# 1. EXECUTIVE SUMMARY

Black Rock Turnpike (Route 58) in Fairfield, CT is a multi-lane, high-conflict arterial road that provides north-south connectivity for motorists between Route 15 and Route 1/I-95. The road also serves a major regional shopping district served by transit and used by bicyclists and pedestrians. Three recent fatalities have prompted local officials to consider engineering solutions for improving safety for all users and balancing the needs of multiple modes.

The recommended concept plan for Black Rock Turnpike strives to address as many safety deficiencies as possible while still offering adequate capacity for cars and trucks. Given the regional commercial status of the corridor, the Town of Fairfield stressed the importance of not further exacerbating current levels of congestion. While some congestion, especially during peak shopping days, is inevitable, fewer crashes will reduce much of the unpredictable delay that results when the corridor is impacted by a crash. In totality, the corridor improvement plan can be best summed up as a strategic set of safety countermeasures that work in concert to reduce vehicle speed, minimize unsafe driver behavior, and offer pedestrians better protection and visibility in the public right-of-way.

The countermeasures in the Recommended Corridor Plan include:

- Lane reductions
- Modern roundabouts
- Enhanced pedestrian crossings
- Intersection modifications
- Access management
- Improved parking lot circulation

Once the project is initiated and a funding source identified, the remaining steps to implement an improvement will involve detailed design and construction. Based on the complexity of a project, an initial Preliminary Engineering phase may be required to conduct a more detailed engineering study and refine the concept plans and project scope. A preliminary engineering study can help establish the potential impacts to environmental and natural resources, identify potential property and utility impacts, and help refine the expected costs in current dollars rather than forecasting based on estimates reported in this Study, which are provided in current, 2018 dollars.

Once Preliminary Engineering is complete and the decision is made to move forward with a project, final design will take place to add detail to the plan, conduct a right of way acquisition process, address utility conflicts and possible relocations, and develop construction documentation to facilitate bidding and construction of the improvements. Generally, projects that are identified as having a low level of complexity can be designed within 12-18 months from initiation of the project by the Towns. As complexity grows, so does the timeframe required to design improvements. Design phases can potentially last three years or more for highly complex projects.

Following the completion of the design phase, projects can begin the construction phase. The steps involved in a publicly funded project include advertisement for bids to contractors, collecting bids on the work and awarding the contract, and finally conducting the construction to build the improvement. Utility relocations typically take place during construction, but in some instances a utility company may relocate facilities in advance of a project taking place once a utility agreement is in place. Generally, smaller projects are completed within one construction season between March and November. Larger projects can span several construction seasons depending on the complexity of the work, the construction staging and phasing needed to facilitate the maintenance and protection of

traffic operations during construction, and possibly the availability of funding. Projects identified as having moderate complexity can be expected to take up to two construction seasons and highly complex projects could take more than two construction seasons to build.

To assist in the budgeting of funding for the improvements, opinions of preliminary probable construction costs (OPC) were developed for the Recommended Corridor Concept. The preliminary costs have been estimated following the guidelines published by the CTDOT and are presented in 2019 dollars. Project costs may require inflation factors looking out into the future to determine actual funding needs for funding programming. The “Preliminary Cost Estimating Guidelines” provide unit costs and percentage-based lump sum costs to facilitate the estimation of project costs at the Preliminary Engineering level of project development. The approximate project costs presented in this Study are limited to the construction item costs and exclude costs related to rights of way actions and environmental remediation, and engineering. The estimates include contingency (25%) and incidentals (25%) in the total opinion of probable costs.

As shown in Table ES-1 below, the improvements outlined in the Recommended Corridor Concept are estimated to cost approximately \$23.1 million to construct. While the Recommended Corridor Plan would provide optimum safety benefits, it is a complex project that could take many years to complete. For this reason, a Near-Term Plan was developed to include improvements to Black Rock Turnpike that would yield a high safety benefit at a significantly lower cost. This plan could also be an early phase implementation of a series of improvements in the Recommended Corridor Plan. The estimated cost for the Near-term Plan was estimated at approximately \$10.1 million.

**TABLE ES-1**

Opinion of Probable Construction Cost Summary – Recommended Corridor Concept

| Intersection |                                                                                  | Opinion of Probable Construction Cost |
|--------------|----------------------------------------------------------------------------------|---------------------------------------|
| 1            | Black Rock Turnpike at Tahmore Drive & Old Black Rock Turnpike                   | \$360,000                             |
| 2            | Black Rock Turnpike at Samp Mortar Drive                                         | \$2,273,000                           |
| 3            | Black Rock Turnpike at Brookside Drive and Fairfield Woods Road                  | \$2,288,000                           |
| 4            | Black Rock Turnpike at Lake Hills & Black Rock Shopping Centers                  | \$3,817,000                           |
| 5            | Black Rock Turnpike at Route 135 (Stillson Road) & Stillson Road                 | \$2,327,000                           |
| 6            | Black Rock Turnpike at Turnpike Shopping Center & Fairway Plaza                  | \$1,139,000                           |
| 7            | Black Rock Turnpike at Katona Drive & Katona Drive Extension                     | \$3,523,000                           |
| 8            | Black Rock Turnpike at Burroughs Road                                            | \$2,675,000                           |
| 9            | Black Rock Turnpike at Tunxis Hill Cutoff, Route 732, Mortiz Pl. & Whitewood Rd. | \$4,746,000                           |
| <b>Total</b> |                                                                                  | <b>\$23,148,000</b>                   |

Table ES-2 and the Figures ES-1 to ES-6 present the recommended corridor concept plan for Black Rock Turnpike in its entirety. The plan is drawn to scale and reflects a level of accuracy consistent with planning/pre-engineering studies.

## 2. INTRODUCTION

The *Black Rock Turnpike Safety Study* was prepared by a project team that consists of several organizations. The MetroCOG managed the project in coordination with the Town of Fairfield. The consultant team was led by Fitzgerald & Halliday, Inc. (FHI) with assistance from Tighe & Bond and CT Counts, LLC. In addition, key stakeholders and the public were an integral part of the project team and was actively involved throughout various study efforts. The total budget for the study was \$375,000 and was fully funded by the State of Connecticut's Local Transportation Capital Improvement Program (LOTICIP).

### Purpose and Study Area

Black Rock Turnpike is a multi-lane, high-conflict arterial road that is frequently used by transit, bicyclists and pedestrians. Three recent fatalities have prompted local officials to look to redesign this road to balance the needs of multiple modes.

#### Purpose

The purpose of the *Black Rock Turnpike Safety Study (Black Rock Study)* was to explore alternatives and strategies that will enhance safety for all users along the corridor, including pedestrians, bicyclists, transit users, and motorists.

This comprehensive transportation planning study assessed Black Rock Turnpike's operational and safety characteristics and developed conceptual solutions that could be implemented over near-term and longer-term timeframes. Robust public engagement guided the study process. Key objectives of the *Black Rock Turnpike Safety Study (Black Rock Study)* as outlined in MetroCOG's Request For Qualifications (RFQ) included:

- Assessment of lane layout and configuration as well as other intersection improvements,
- Analysis of traffic signal coordination throughout the corridor,
- Recommendations for bicycle, pedestrian and transit amenity improvements in the study area; including adjacent residential neighborhoods,
- Analysis of the role and use of local roads intersecting Black Rock Turnpike and evaluate all local road approaches,
- Evaluation of road widths and cross-sections,
- Analysis of the potential elimination or reduction of curb cuts throughout the study area,
- Assessment of future development in the corridor,
- Integration of current and future GBT bus routes along Black Rock Turnpike,
- Identification of the need and location of additional crosswalks in the study area, and
- Feasibility determination of bike lane installation throughout the corridor.

#### Study Area

The Black Rock Turnpike is a major arterial that serves one of Fairfield's largest business and commercial districts. As a state highway (Route 58), the Turnpike is a main north/south corridor in Fairfield. It provides a key connection for residential neighborhoods to retailers and services as well as a vital link between U.S. Route 1 and Interstate 95 in the south and the Merritt Parkway (Route 15) in the north. Approximately 20,000 vehicles travel along the turnpike every day and this volume of traffic combined with the road width, traffic speed, and frequent driveways have caused the Turnpike to be identified as a trouble spot by The Town of Fairfield.

**Figure 1: Town of Fairfield Transportation Network**

The study area for this project focuses on the area between the Black Rock Turnpike intersection with Tahmore Drive and Old Black Rock Turnpike to the north and Tunxis Hill Road to the south. Along this segment, the road widens from a single lane in each direction to a multi-lane arterial with frequent access to adjacent land uses.

In response to public input, the project team also performed a cursory analysis of the segment of Black Rock Turnpike directly north of the study area from the intersection with Tahmore Drive to the Merritt Parkway. While this section was not part of the predetermined study area, the public expressed concern about safety issues along this part of the roadway, which primarily serves residential properties and provides access to the Merritt Parkway. It was determined that much of the safety-related issues on this segment are associated with the highway interchange, and as such, should be evaluated independently from this study.

**Figure 2: Black Rock Turnpike Study Area**

While this study is primarily focused on the transportation aspects of this corridor, the plan recognizes that the transportation network plays a key role in establishing the character of a community and the quality of life that is enjoyed by its residents and visitors.

## Study Process

The overall approach for the *Black Rock Study* was to take a broad perspective on the role and function of Black Rock Turnpike, and through a contemporary planning process, apply innovative engineering solutions to address safety, mobility, and accessibility along the corridor.

First and foremost, the study was guided by an inclusive public engagement process. The study team listened to concerns from the public, as well as their aspirations for the future of the corridor. This

was coupled with an innovative data collection and analysis methodology to better understand and communicate the corridor's complexities. This approach ensured that the Study Team was focused on solutions that meet the needs and desires of the community.

**Figure 3: Black Rock Turnpike Safety Study Approach**

The study included three main phases, generally described as Phase I: Discover, Phase II: Design, and Phase III: Reporting. This approach provided a simple framework for identifying the issues along Black Rock Turnpike, evaluating potential solutions, and creating a plan for the Town of Fairfield to use in updating the road over time.

**Figure 4: Black Rock Turnpike Safety Study Schedule**

## 3. EXISTING CONDITIONS

### Major Findings

A full analysis of existing and future transportation conditions on Black Rock Turnpike is presented in the Existing & Future Conditions Technical Memorandum. The following chapter reviews the major findings in that report.

#### *Transportation Network Overview and Context*

The Black Rock Turnpike is designated as an urban minor arterial throughout the corridor study area. The major intersection in the corridor, the intersection of the Black Rock Turnpike (Route 58) and Stillson Road (Route 135) is centrally located in the study area. Stillson Road is designated as a minor arterial to the northeast and southwest of the study area. Furthermore, Route 58 is intersected by Route 732 also identified as a minor arterial.

Travel patterns throughout the corridor are heavily influenced by the proximity to two major highways - I-95 to the south and the Merritt Parkway (Route 15) to the north. This proximity makes the Black Rock Turnpike a common commuting route to regional employment destinations and nearby neighborhoods. Locally, the Black Rock Turnpike provides direct access to a major commercial district in the Town of Fairfield. This access is largely provided by numerous unsignalized curb cuts in the core of the corridor between Samp Mortar Drive and Burroughs Road to the south.

Contextually, the Black Rock Turnpike passes through several types of land-uses on its 1.7-mile extent included in this study. This includes dense residential neighborhoods to the south which form some of Fairfield's densest residential neighborhoods. Within these

neighborhoods are many neighborhood schools including the nearby McKinley Elementary school located near the southern end of the corridor. Furthermore, many other schools are near the Black Rock Turnpike including Fairfield Warde High School, Osborn Hill Elementary School, Holland Hill School, and Fairfield Woods Middle School.

**Figure 5: Black Rock Turnpike Land Use Context**

North of this southern neighborhood zone is the core commercial district defined by the borders of Burroughs Road to the south and Samp Mortar Drive to the north. Within this commercial zone are typical suburban commercial developments including both large scale multi-tenant commercial plazas as well as older, and smaller, individual commercial buildings. This historical growth and development of commercial area mean that curb cuts are numerous throughout this core area and cross property connections are infrequent. Off-street parking via surface lots is prevalent throughout

this corridor and is typically provided between the Turnpike and the front of buildings.

Lastly, the zone north of Samp Mortar Drive consists of suburban residential land uses. Houses include driveways with direct access to the turnpike with ample set back from the roadway. This residential context continues to the north and extends about 16 miles north to Bethel, CT.

### Road Conditions

The study area lane configuration varies between two-lanes to five-lanes. The north and south ends of the study area consist of two lanes of traffic, one in each direction, and the central portion has four lanes of traffic, with a fifth lane for left turns at the Route 135 (Stillson Road) intersection. Generally, Black Rock Turnpike has inconsistent shoulders ranging 1 foot to 10 feet wide, with wider shoulders at the north and south ends of the study corridor and narrower along the denser development in the center of the study area. Undersized shoulder widths of less than 4 feet challenges bicycle and pedestrian travel along the corridor.

Black Rock Turnpike is a road marked with numerous driveways. The number of driveways, or curb cuts, increases the number of potential conflicts, both vehicular and non-vehicular alike, while also contributing to congestion, confusion, and frustration for motorists as they attempt to find a break in traffic.

**Figure 6: Black Rock Turnpike Typical Conditions**

### Bicycle and Pedestrian Activity

Bicycling and pedestrian use along the corridor is relatively light when compared against the volume of vehicular traffic, but non-motorized activity is present and would likely be higher if conditions to improve the comfort and safety of those travel modes were made.

Bicycling data for the study area suggested that the area along the Turnpike north of Samp Mortar Drive is more suitable for bicyclists. South of Samp Mortar Drive, where the roadway's geometry and character abruptly changes, the bicycle use along the Turnpike significantly drops. It appears that bicyclist may be bypassing Black Rock Turnpike by utilizing Pansy Road and Judd Street.

**Figure 7: Bicycle Activity** (Source: Strava Data from November 1, 2014 through October 31, 2016)

While there is relatively low bicycle ridership along the Black Rock Turnpike, it is difficult to determine whether this is because bicyclists do not prefer to take this route or whether they do not take the route due to the lack of safe and/or comfortable facilities. It's possible that bicyclists would ride on this route if facilities existed to make it safer, especially because the Turnpike does provide a convenient and quick connection between many key destinations in town.

Pedestrian traffic across Black Rock Turnpike is mostly concentrated between Fairfield Woods Road and Judd Street, which is where the main commercial shopping opportunities are located. The intersection which received the highest amount of pedestrian traffic

was at Stillson Road, which is at a central point of the study area and provides access to numerous commercial businesses. Pedestrian activity during the PM hours on the weekdays is typically higher than morning hours since commercial activity increases as the day progresses. There was also more overall activity during the midday hours on the weekend when compared to any time during the weekday, which is a result of higher shopping demand.

### Transit Needs

Transit in the study area consists of a single bus, Route 10, operated by Greater Bridgeport Transit (GBT). Bus stops are provided throughout the corridor, most marked by a GBT sign including basic route information. Bus stops do not feature shelters or benches. All GBT buses are equipped to carry bicycles, with racks available on a first-come, first-serve basis.

Of note for a study corridor with significant retail activity is that Saturday ridership exceeds weekday (and Sunday) volume. In this case, Black Rock Turnpike functions more as a destination than an origin for transit trips.

Transit riders are also pedestrians, and thus issues pertaining to safety, comfort and accessibility at the street and sidewalk level apply to GBT bus riders. Some sidewalk gaps exist along the study corridor and numerous curb cuts affect the walking environment and safety for pedestrians.

**Figure 8: Pedestrian Crossing and Typical Transit Stop**

Bus layover locations are an ongoing concern for Greater Bridgeport Transit, as transit reliability is dependent on scheduled down-time for bus operators at route ends. Currently, GBT uses the turnaround loop via Fairfield Woods Road and Stillson Road to lay over; however, community pressures over the years have often forced GBT operators to move buses or find new space. GBT would benefit from a formal, agreed upon layover location to ensure reliable operation of Route 10.

### Traffic

A review of the historic average daily traffic (ADT) volume data collected indicates daily traffic volumes along Black Rock Turnpike peaked around 2005 and declined until 2013. Following 2013, volumes have shown a modest increasing growth trend, averaging between 18,000 and 23,000 vehicles per day. Traffic levels during the weekday afternoon and Saturday peak hours tend to be higher than other periods throughout the week, which reflects higher percentages of retail traffic mixing with the commuter traffic. The

busiest areas on Black Rock Turnpike occur proximate to the larger retail developments. Traffic is lighter north and south of the Study Area. This pattern is consistent with the intensity of land uses along Black Rock Turnpike.

Results of the traffic analysis indicate that most of the study intersections operate at a Level of Service (LOS) D or better during typical weekday morning and afternoon and at LOS B or better during typical weekday midday and Saturday peak hours. Although LOS A through D are generally deemed acceptable for developed areas, there are situations where a specific intersection approach or movement experiences LOS of E and F (the lowest), even if the total intersection does not. These occurrences typically occur during peak travel times in the morning or evening and motorists traveling along such approaches can often experience delays. In addition, the complex interaction of driveways upstream and downstream of intersections often creates congested conditions that the modeling of individual intersections does not consider. Still, the LOS analysis is a valuable tool for checking the effectiveness of signal timing and lane configurations at the major corridor intersections.

Queuing exists at specific approaches to the intersections in the central portion of the study area between the intersections with Samp Mortar Drive and the Turnpike Shopping Center and Fairway Plaza driveways. Along this segment the closely spaced intersections and high traffic volumes from the dense commercial development result in queues that extend beyond the available road storage, resulting in additional congestion that may not be fully represented in the level of service results. It is important to recognize that when conducting traffic operations modeling that several factors need to be considered when measuring the effectiveness of a roadway to efficiently move traffic. The complex operation of Black Rock Turnpike is difficult to model, and though the signal systems seems

to be capable of handling the volume of traffic, many other factors are responsible for the delay often experienced by motorists.

The vehicle speeds during the off-peak (low volume) hours of the day were consistently higher than during the peak (high volume) hours. Off-peak vehicle speeds had the highest variation from peak-hour speeds in the southbound direction, south of Stillson Road and in the northbound direction, north of Arrowhead Lane. Since commercial development and pedestrian activity also increases to the south of Stillson Road, higher vehicle speeds during the off-peak hour in this location are potentially hazardous. It should also be noted that vehicle speeds during both the peak and off-peak hours were highest at the far north and far south ends of the study area (west of Arrowhead Lane and east of Black Rock Turnpike). In the peak hours, average vehicle speeds were approximately 35mph in both locations, in both directions (southbound and northbound). In the off-peak hour, average vehicle speeds were approximately 40mph in both locations and in both directions. These higher speed conditions make pedestrian and bicycle crossings difficult and potentially hazardous. Speeds higher than 25 miles per hour are statistically proven to be responsible for serious injuries and/or fatalities when pedestrians are involved in a crash. High speed coupled with the high frequency of driveways is a recipe for diminished safety for all road users.

### Safety

Across the three-year analysis period (2014-2016), there were 428 total crashes that occurred within the study area—a road segment approximately 1.73 miles in length.

A crash rate of 11.9 crashes per million vehicle-miles of travel was calculated, which is approximately two times higher than the average crash rate (5.8 crashes per million vehicle-miles) on an urban four-lane undivided roadway in Connecticut. Four-lane roads are almost always higher in crash occurrences due to the complex weaving characteristics, speed and diminished sight lines. When adjusting the crash rate for the highest crash segment of Black Rock Turnpike from the intersection with Whitewood Drive to the intersection with Samp Mortar Drive, a crash rate of 19.1 crashes per million vehicle-miles travelled was calculated. This crash rate is over three times higher than the average crash rate on a typical urban undivided roadway in Connecticut. Over the course of the three-year study period, the majority (77%) of the crashes were property-damage-only crashes. Twenty-two percent (22%) of the crashes involved an injury. There were three fatal crashes, occurring in the three-year period analyzed.

Figure 9: Locations of Crashes by Type (Source: Connecticut Crash Data Repository, September 2017)

For the segment of Black Rock Turnpike north of Tahmore Drive, the overall crash rate is significantly lower than the crash rate for the same period along the primary study area. The lower crash frequency does not diminish the serious consequences of the crashes that did occur; however, most of those crashes are related to the Merritt Parkway ramp system and should be more thoroughly evaluated independently from this study.

## Supplemental Drone Data

In addition to the count data, the study team collected video footage of the corridor using several aerial drones. This footage was taken for approximately 15 minutes at 5:00 PM on Wednesday, October 11th. Given the complexity of traffic conflicts along this corridor, the study team used this information to confirm the traffic count data that was collected via other sources as well as to better understand complex operational characteristics. The video and data were also used to calibrate the traffic models which provided the Study Team with a higher level of confidence in the proposed concept plans.

Once collected, the drone videos were processed by Data From Sky, a company that builds software to extract the time-space-trajectories of vehicles in aerial videos. This approach provided automatic calculation of a wide range of traffic parameters, such as speed, acceleration, and detailed traffic counting that was simply not possible with conventional tools. When used as a supplement to the existing data collected, the sample video footage answered many questions that the Study Team had about how the corridor was used and provided a visual way to communicate complex operational conditions to the public.

**Figure 10: Mike Gearin from PhotoFlight Aerial Media Launches a Drone**

**Figure 11: Drone flight coverage area**

**Figure 12: Screen-capture of Vehicle Trajectories along Black Rock Turnpike**  
(Source: PhotoFlight Aerial Media and Data From Sky, October 2018)

Following the post processing of the aerial video, the Study Team used the software developed by Data From Sky to analyze a range of conditions that led to a more nuanced understanding of the corridor, and ultimately, a more thoughtful range of potential solutions.

The earlier data collection effort provided limited speed data at a few spot locations but didn't fully explain where high speed activity was most common. The video data provided a much clearer picture of locations where high-speed traffic occurs and where it mixes with lower-speed vehicles. Speed is the greatest contributor to crashes, both in terms of frequency as well as severity. Seeing where average speed above posted speeds was allowed for the targeted application of safety countermeasures in the recommended plan presented later in this report. Figure 13 shows a speed heat map of the corridor.

Another common issue that exists on multi-lane arterials with a high degree of driveway access is frequent lane changing behavior. Drivers who frequently change lanes to avoid slower or turning vehicles present a higher risk of collision. Using the aerial video and software analysis, the Study Team was able to track all the vehicles making a complete trip from one end of the corridor to the other and count how many times those vehicles were changing lanes.

As listed in Table 1, the southbound direction of Black Rock Turnpike experienced a higher degree of frequent lane changing behavior with at least 40% of counted vehicles making at least four lane changes, and some making as many as eight. In the northbound direction, the lane changes were less pronounced with most of the traffic making one to two lane changes between Tunxis Hill Cutoff and Brookside Drive. This data was instrumental in identifying safety countermeasures aimed at stabilizing traffic flow and reducing risky driving behavior.

|                | Southbound   | Northbound   |
|----------------|--------------|--------------|
| # lane changes | % of traffic | % of traffic |
| 0              | 100%         | 100%         |
| 1              | 88%          | 57%          |
| 2              | 77%          | 29%          |
| 3              | 68%          | 21%          |
| 4              | 40%          | 14%          |
| 5              | 28%          | 7%           |
| 6              | 14%          | 0%           |
| 7              | 4%           | 0%           |
| 8              | 2%           | 0%           |

**Table 1: Number of Lane Changes along Black Rock Turnpike** (Source: PhotoFlight Aerial Media and Data From Sky, October 2018)

**Figure 13: Average Vehicle Speed** (Source: PhotoFlight Aerial Media and Data From Sky, October 2018)

Another frequent assumption is that the typical commuter hours of the day experience more ‘through’ traffic than other time periods. Through traffic is that which passes through the corridor without stopping along the way. This assumption sometimes leads to improper responses to corridor development because it suggests that commuter traffic be facilitated by providing greater road capacity to reduce congestion.

Along Black Rock Turnpike, the drone analysis was able to count each vehicle as it entered the video and track it until it made a turn or came to a stop in a parking lot. In the northbound direction, only 20% of entering traffic passed through the corridor to the opposite end. In fact, 52% of all northbound traffic was destined for a business along the way. In the southbound direction, those values were 28% and 35% respectively. The value of knowing this information established the need to provide safer access to commercial properties for all modes of travel as a primary objective. This section of the Turnpike is a retail destination and as such would benefit from solutions that deemphasized the high-speed and highway-centric design characteristics of the past.

**Figure 14: Northbound Travel Patterns along Black Rock Turnpike** (Source: PhotoFlight Aerial Media and Data From Sky, October 2018)

**Figure 15: Southbound Travel Patterns along Black Rock Turnpike** (Source: PhotoFlight Aerial Media and Data From Sky, October 2018)

Regarding congestion and driver delay along the Turnpike, the data suggests that human perception paints a slightly different picture than reality. Given the frequency of crashes along the corridor, extreme congestion is something that most people using the Turnpike have experienced at one time or another. However, this is not a typical condition as evidenced by the data collected in this study. Under typical PM peak hour conditions, vehicular travel time from the Tunxis Hill Cutoff to just north of Brookside Drive takes about three minutes. This time includes any stop delay experienced at traffic signals and is an average time for all vehicles that made the end-to-end trip and captured in the drone video.

It should be noted that this time confirmed similar travel times measured with conventional data collection methods earlier in the study process. Atypical conditions, such as high demand shopping days (e.g. the Christmas holiday week) could certainly result in greater delay than was measured.

**Figure 16: Screen-capture of Vehicle Trajectories along Black Rock Turnpike**  
(Source: PhotoFlight Aerial Media and Data From Sky, October 2018)

**Figure 17: Screen-capture of Vehicle Trajectories along Black Rock Turnpike**  
(Source: PhotoFlight Aerial Media and Data From Sky, October 2018)

Another assumption requiring confirmation from the drone data was the relative usage of each travel lane by direction. The term lane utilization was used to explain how much traffic used the inside and outside (curbside) lanes. This was an important observation because on most multilane roads with frequent driveway access, the inner

lanes carry lower volumes of traffic because the inner lanes serve as de facto left turn lanes when protected left turn pockets don't exist.

Based on the drone video analysis, approximately 60% to 70% of the traffic uses the curbside lane in the northbound direction. In the southbound direction, results are similar, with over 80% curbside utilization at the intersection of Fairfield Woods Road. These findings were significant because they verified that reductions in the number of travel lanes was possible along certain locations of the Turnpike. By reducing through lanes and providing protected left turn pockets, traffic flow could potentially be smoother, speeding reduced, pedestrian crossings shortened, crashes reduced, and side-street delay minimized.

**Figure 18: Northbound Lane Utilization along Black Rock Turnpike** (Source: PhotoFlight Aerial Media and Data From Sky, October 2018)

**Figure 19: Southbound Lane Utilization along Black Rock Turnpike** (Source: PhotoFlight Aerial Media and Data From Sky, October 2018)

The drone video analysis allowed the Study Team to confirm several previously observed conditions with concrete data verification. As the various traffic models used in the study were developed, the video results led to a much better calibration to real-world conditions than would have been possible with the conventional data sources available.

## Conclusions

Black Rock Turnpike is a 4-lane state highway originally designed to facilitate regional travel with a modest level of access to private property. Over the years, the segment of the Turnpike between Samp Morte Drive and the Tunxis Hill Cutoff has evolved into a major

commercial corridor with very high levels of access to property. The physical design of the road encourages high speed driver behavior, and the heavy traffic volume that results from a mix of shopping and commuter traffic creates an environment that is compromised for both travel mobility and accessibility to properties along the road. In fact, this segment of the Turnpike has a crash rate 2 to 3 times higher than that of a typical 4-lane urban road in Connecticut.

In addition to diminished safety and driver frustration stemming from congestion, Black Rock Turnpike also presents a hostile environment for pedestrians and bicyclists. Whether walking along the Turnpike or crossing it, pedestrians are often at a significant disadvantage. Crosswalks are infrequent and long, pedestrian visibility to motorists is low, and the frequent driveways pose a constant threat to those walking the sidewalks. Bicyclists, save the very skilled riders, appear to avoid Black Rock Turnpike in favor of other routes even though they aren't as direct.

Based on the data collected and analyses performed as part of this existing conditions evaluation, the study team concluded that Black Rock Turnpike requires a level of redesign that emphasizes safety for all users, while still maintaining adequate access to the residences and businesses along its length. In areas with high crash frequencies and/or severe crashes, near-term mitigations are necessary. In the longer-term, a more system-wide solution to dealing with a wide range of stated deficiencies may be necessary.

*Figure 20: Screen capture of VISSIM traffic model calibrated with PM peak hour drone data*

## 4. FUTURE NO-BUILD CONDITIONS

A future 20-year growth rate for traffic on Black Rock Turnpike was calculated for the purpose of developing roadway solutions that are expected to satisfy future transportation demands. Historic average daily traffic (ADT) was collected for Black Rock Turnpike and intersecting routes (e.g. Rt. 135 / Stillson Road and Rt. 732 Tunxis Hill Cut Off) from 2001 to 2013. This data was supplemented with 24-hour traffic counts collected in 2017. The annual average percent change (AAPC) from 2001 and 2017 for all count locations along Black Rock Turnpike is -0.2% per year – essentially no growth.

In addition to the traffic data, the study team conducted an interview with property owners of a significant portion of the retail space along the corridor. Their anecdotal assessment of future conditions is that the retail environment is changing due to the intense competition from online retailers. This is resulting in lower demand for space that can be used for large shopping establishments and an increase in demand for fitness centers, such as yoga studios and health clubs, which have different traffic peaking characteristics. In summary, they don't see meaningful traffic growth as a result of changing retail into the future. If anything, they see more spreading of traffic throughout the day as a possibility.

Based on the quantitative and anecdotal data, it is assumed that Black Rock Turnpike from Tahmore Drive to the Tunxis Hill Cutoff will experience a flat growth rate over the next 20 years; however, the Town of Fairfield anticipates some additional housing development near the study corridor and wishes to include some limited traffic growth in the future forecast. As a result, the study used a modest growth rate of 0.25% per year from 2017 to 2027. This growth rate

was applied to the peak hour traffic data and used in traffic models to predict future peak hour operations at study area intersections.

### Future Conditions Traffic Assessment

The future conditions analysis included traffic growth projections to expand the 2017 existing traffic volumes to the 2040 background traffic volumes. The Black Rock Turnpike study area intersections were analyzed under two scenarios: a 'Background' and a 'Background-Optimized' condition. The 2040 Background analysis utilizes existing road geometry and existing traffic signal settings to draw a direct comparison between existing and future conditions. The 2040 Background-Optimized analysis utilizes existing road geometry but modifies intersection signal timings and settings to provide the most efficient operations for future conditions. This optimization analysis determined if future operational issues can be mitigated through low-cost adjustments to signal operations or if additional physical improvements are needed to provide measurable capacity improvements. Although these Background analyses provide a basis for generating roadway improvements to accommodate anticipated traffic growth for the corridor, they do not factor in safety related issues, which was a primary factor in developing corridor improvements.

### Background Traffic Operations

Utilizing the existing geometry and traffic signal settings established under the 2017 Existing Traffic analyses, traffic operations for the 2040 Background Traffic Volumes were evaluated for the study area intersections using Trafficware's *Synchro plus SimTraffic 10 – Traffic Signal Coordination Software*, based on the *Highway Capacity Manual (HCM) 6<sup>th</sup> Edition* methodology.

The background traffic growth slightly exacerbates existing capacity issues detailed in the Existing Conditions Technical Memo. Comparing the existing conditions to the background conditions, the following overall LOS deterioration was identified from the analyses during the specified peak hours:

- Black Rock Turnpike at Tahmore Drive: Decreased from C to D in the afternoon
- Black Rock Turnpike at Stillson Road: Decreased from D to E in the afternoon
- Black Rock Turnpike at Fairfield Woods Road: Decreased from A to B on Saturday
- Black Rock Turnpike at Turnpike Shopping Center: Decreased from B to C on Saturday
- Tunxis Hill Cutoff at Tunxis Hill Road (unsignalized): EBL decreased from C to D on Saturday

Select intersection approaches also experienced decreases in LOS, mainly at the intersections where the overall LOS experienced a decrease. These decreases are a result of the incremental growth in traffic volume, which cause incremental increases in delay and subsequent decreases in LOS. Just as with the existing conditions scenario, the most significant congestion is focused on the Black Rock Turnpike at Stillson Road (Route 135) intersection.

### Background Optimized Traffic Operations

The 2040 Background Traffic Volumes were also analyzed with an optimized traffic network where the lane geometry remained unchanged, but traffic signal timings were optimized and additional coordination was added along the corridors. The purpose of the 2040 Background-Optimized traffic analysis is to determine how the

existing signalization along the corridor would process expected future traffic volumes without any significant physical improvements.

The optimization process included a review of the coordinated system on the corridor, the coordinated system cycle lengths, and signal phase timing splits to balance delays on the intersection approaches to increase the efficiency of traffic operations. It also included modifications to the closed loop signal timing offsets which impact the progression of vehicles through the corridor. The optimization method was similar to the process employed by CTDOT, which monitors state-maintained closed loop systems and periodically modifies the signal timings based on current volumes to maintain operational efficiency. The optimization of the traffic signal operation included the following:

- Expansion of the existing closed loop coordination system on Route 58 (Black Rock Turnpike) to include all intersections from Tahmore Drive to Tunxis Hill Cutoff except for the intersection with Stillson Road, which runs free from coordination similar to the existing conditions
- Optimization of the study area intersection splits within existing minimums
- Optimization of the network cycle length and offsets for the coordinated system

The traffic signal optimization mitigates most of the delay caused by the additional background traffic growth. The following changes to LOS were identified from the analysis:

- Black Rock Turnpike at Tahmore Drive: Improved from D to C in the afternoon

- Black Rock Turnpike at Samp Mortar Drive: Improved from B to A midday
- Black Rock Turnpike at Fairfield Woods Road: Decreased from A to B midday
- Black Rock Turnpike at Turnpike Shopping Center: Improved from C to B on Saturday

The decrease in LOS at the intersection of Black Rock Turnpike at Fairfield Woods Road arose from a higher prioritization of other coordinated intersections in the optimization process in order to facilitate better operations along the corridor in its entirety. Significant overall intersection delays only persist at the intersection of Route 58 (Black Rock Turnpike) at Route 135 (Stillson Road) which operates at overall LOS E during the afternoon peak hour. However, there are individual movements at intersections along the corridor that operate at failing LOS E and F conditions and/or have queues extending beyond available storage. As a result, these Background Optimized analyses served as a basis for the creation of the recommended corridor concept plan, which aims to improve traffic congestion while also balancing traffic safety for all users of the corridor.

## 5. PUBLIC ENGAGEMENT

This Study has benefited from extensive community outreach that was intended to provide interested parties with a means to communicate their transportation needs and concerns with the project team. This input has greatly contributed to the team's understanding of the Turnpike and has guided the development of recommendations throughout the study.

The following summarizes the community engagement activities that have occurred thus far and has ensured that the *Black Rock Study* results in a plan that responds to the needs and desires of those who travel along and spend time on the Turnpike.

### Committees

The *Black Rock Study* is intended to be a collaborative effort among the many stakeholders with a vested interest in the future of the Black Rock Turnpike. As such, the project team received guidance from two advisory committee, both of which met throughout the project. The responsibilities of these committee members are as follows:

- Provide insight and expertise on local conditions and issues;
- Collaborate with the project team to brainstorm potential ideas and recommendations;
- Review and provide feedback on project products before they are broadly distributed to the public; and
- Assist with the project team's public and stakeholder outreach effort by (1) identifying information resources and potential lines of communication; and (2) helping to raise awareness about community outreach efforts.

The two committees are described in further detail below.

### Technical Advisory Committee

The Technical Advisory Committee (TAC) is comprised of representatives from the public organizations and agencies that are involved in the study. The project team met with the TAC three times over the course of the study to discuss technical issues about engineering, design guidelines, policies, and more.

### Community Advisory Committee

The Community Advisory Committee (CAC) includes representatives from local businesses as well as community organizations, groups, and institutions with key expertise and local knowledge about the Black Rock Turnpike. The CAC met twice over the course of the study to help the team understand local conditions in the neighborhood.

### Website

A publicly accessible project website accessed via <http://bit.ly/blackrocksafetystudy>, was developed and hosted on MetroCOG's website. The public has been encouraged to visit the website to learn more about the Black Rock Study, view meeting announcements and related materials, review published material and draft documents, and submit comments.

A significant number of comments were received via the website ([blackrockstudy@fhiplan.com](mailto:blackrockstudy@fhiplan.com)) and the project email that varied from questions, input, new ideas, and other considerations. The project team took this input into account throughout the Black Rock Study.

In addition, business cards with the project name, logo, and website address have been distributed to the public and available at all engagement events. Comments received over the course of the study are available in Appendix A.

### Pop-Up Outreach Event

Two pop-up events were conducted on

1. Saturday, June 3<sup>rd</sup>, 2017, near the entrance/exit to ShopRite along the Black Rock Turnpike, and
2. Saturday, September 23<sup>rd</sup> at the Kiwanis Craft Fair on Town Green.

The purpose of the events was to:

- Solicit input on the community's impressions of the Turnpike's existing issues.
- Introduce the community to the project and encourage the community to attend the June and November (2017) Public Meetings.
- Distribute the URL link to the online survey (June 2017).

### Online Survey

An online survey was conducted during the summer of 2017 to help the project team better understand the issues and opportunities for all those who travel along the Turnpike, including motorists, bicyclists, pedestrians, and transit users. The survey was available for the public to participate from Monday, May 22<sup>nd</sup> to Friday, July 28<sup>th</sup> and it was advertised via a press release from the Town of Fairfield; social media sites for MetroCOG and the City of Fairfield; various mailing list-serves, including the one developed for this project; the Committee members' networks; local community blogs and websites; and more.

A total of 1,069 people completed the survey, approximately 70% of whom live in Fairfield. Respondents answered questions about how and why they currently travel along the Black Rock Turnpike as well as what improvements they would like to see along the Turnpike in the future. A full compilation of results, including comments, can be found in Appendix A of the Existing and Future Conditions Technical Memorandum.

As the following graph indicates, most travelers using the Turnpike are destined for shopping or dining purposes. As a major regional retail corridor this is not surprising; however, it is important to recognize that the corridor is adjacent to several neighborhoods, so it serves as access to and from homes and employment locations.

**Figure 21: Trip purpose survey results**

When asked how ambitious the Study Team should be regarding corridor modifications, most respondents (56%) wanted to see safety improvements and general road maintenance. Still, many respondents (39%) indicated that a new corridor vision and full redesign of the road was needed. Only 5% of respondents voted to keep the road the way it currently is.

**Figure 22: Survey response for how ambitious the corridor plan should be**

While a full range of improvements was desired, most respondents wanted to maximize safety while relieving congestion.

**Figure 23: Survey response for study objectives**

### Public Meeting #1

Three public meetings were held over the course of the study. The first public meeting was held on Wednesday, June 7<sup>th</sup>, 2017 at 7:00 PM at All-Purpose Room at Osborn Hill School. The meeting included a presentation and small group breakout sessions for an interactive activity aimed at helping the Study Team understand the issues along the corridor.

**Figure 24: Small Group Working Session, June 7<sup>th</sup> Public Meeting**

### Public Meeting #2

The second public meeting was held on Thursday, November 16<sup>th</sup>, 2017 at 7:00 PM at the All-Purpose Room at Osborn Hill School. After a presentation on the corridor needs and opportunities, the audience was polled to get a sense for the types of improvements that they wanted the Study Team to evaluate for Black Rock Turnpike.

Based on a polling exercise at the meeting, there was general acceptance of a range of potential solutions for Black Rock Turnpike. Potential improvements that the public was strongly in favor of is as follows:

- Access Management – the practice of consolidating driveways and controlling access in order to improve safety
- Road Diet – reducing the width of a road by narrowing lanes or removing travel lanes
- Enhanced Crosswalks – Installing high visibility pedestrian crossings using special pavement, lighting, landscaping and refuge islands

Potential improvements that the public was generally in favor of, but had some reservations is as follows:

- Median Barriers – Using raised medians to restrict left turns in and out of driveways to improve safety and traffic flow
- Roundabouts – a traffic control device that calms traffic, reduces crashes, and allows for lane reductions

Potential improvements that the public was not in favor of is as follows:

- Bicycle Lanes – providing a dedicated lane for bicycle travel

### *Public Meeting #3*

The third and final public meeting was held on Thursday, November 5<sup>th</sup>, 2018 at 7:00 PM at the All-Purpose Room at Osborn Hill School. The purpose of the meeting was to present the concepts to the public and document their feedback. The event was well attended and there was generally positive reaction to the concept plans. No significant revisions to the recommendations were necessary as a result of the meeting.

### *Property Owner Meetings*

The Study Team met with Kleban Properties on two occasions during the study. The first meeting provided feedback on corridor growth potential which was helpful in determining a future year traffic

forecast. The second meeting was for the purpose of reviewing the initial concept plans and getting feedback on how the major retail establishments on the Turnpike would operate under some of the proposals. The meeting resulted in several modifications to the initial concept plan.

## 6. CONCEPTS

### Initial Concept

The initial concept for Black Rock Turnpike was developed with the primary purpose of addressing the safety issues in the corridor. This concept plan was tested using PM peak hour data from the traffic count program and the drone analysis. A computer traffic simulation model was developed to guide the design of the improvements.

The initial concept was developed with optimum safety as the goal. As such, the concept had some drawbacks regarding traffic congestion and property access. As the Study Team met with affected stakeholders and the public, it became clear that some of the recommendations would not receive community support and would need to be removed from the plan. The initial concept can be found in Appendix B to this report, so that all ideas to address safety deficiencies in the corridor remain documented.

### Recommended Plan Components

The recommended concept plan for Black Rock Turnpike strives to address as many safety deficiencies as possible while still offering adequate capacity for cars and trucks. Given the regional commercial status of the corridor, the Town of Fairfield stressed the importance of not further exacerbating current levels of congestion. While some congestion (especially during peak shopping days) is inevitable, it is expected that fewer crashes will reduce some of the unpredictable delay occurring along the corridor. In totality, the corridor improvement plan can be best summed up as a strategic set of safety countermeasures that work in concert to reduce vehicle speed, minimize unsafe driver behavior, and offer pedestrians better

protection and visibility in the public right-of-way. The important elements of the plan are detailed in the following sections.

#### Lane reductions

Reducing the number of lanes on 4-lane roads can have a dramatic effect on reducing the number of crashes. There are several noteworthy benefits of reducing the number of lanes:

- Reduced lane changing behavior
- Improved lines of sight for drivers exiting driveways
- Consistent and safe traffic speed
- Reduced crossing distance for pedestrians
- Improved ingress/egress at driveways

Although a conventional road diet (reducing 4 lanes to 2 lanes plus a two-way-left-turn-lane) was not possible for the entire length of Black Rock Turnpike, the reduction of a travel lane entering the corridor from both the north and south is possible. The value of establishing single lane approaches to the corridor is that traffic enters at a controlled rate of speed which sets the tone for safer driving behavior. The abrupt change of environment from low density residential land uses to the north and south, to high density commercial requires physical design interventions aimed at reducing vehicular speed and requiring maximum driver attention. Detailed traffic analysis performed in this study proved that limited lane reductions can be effective at achieving these objectives.

**Figure 25: Lane reduction segments**

## Modern roundabouts

Another traffic control feature that is recommended for strategic locations along the Black Rock corridor is the modern roundabout. A roundabout is a type of circular intersection but is quite unlike a neighborhood traffic circle or large rotary. Roundabouts have been proven safer and more efficient than other types of circular intersections.<sup>1</sup> Roundabouts have the following noteworthy benefits:

- Promote slower vehicle speeds
- Reduced vehicle queuing
- Safer pedestrian crossings
- Reduced crash potential

<sup>1</sup> <https://safety.fhwa.dot.gov/intersection/innovative/roundabouts/>

- Allows for potential lane reductions

In the initial concept design, three locations were identified for possible roundabout applications. These locations were as follows:

1. At the Tunxis Hill Cutoff
2. At Katona Drive
3. At the Old Navy/Trader Joe's driveway

After reviews with property owners and thorough evaluation of potential impacts, the Katona drive roundabout was eliminated from the recommended plan. This was largely due to the roundabout's inability to process weekend shopping traffic.

A roundabout at the Tunxis Hill Cutoff serves as a corridor gateway treatment. This complex intersection would benefit from a simplified roundabout and would facilitate a lane reduction northbound to Burroughs Road and southbound approaching the roundabout. This segment of the Turnpike was determined to consist of high-speed traffic and limited pedestrian crossing opportunities. The roundabout establishes a transition from the lower density residential corridors to the east and south, to the conflict-rich commercial environment to the north. Given the concentration of bicycle and pedestrian crashes near the Burroughs and Katona intersections, establishment of slower traffic and safer driver behavior was a top priority.

The second location for a roundabout is at the driveways with Old Navy Plaza and Trader Joe's. These offset driveways prove challenging for drivers to enter and exit across multiple traffic lanes filled with high speed traffic. The proposed roundabout at this location would serve to slow vehicles travelling along the Turnpike, while providing improved access to adjacent properties. This

roundabout would require significant redesign of adjacent parking lots and would likely result in the loss of several parking spots. The tradeoffs include:

- Slower traffic speed
- Reduced crashes at the driveways
- Safer pedestrian crossing opportunities
- A turnaround and staging area for Greater Bridgeport Transit District buses

**Figure 26: Modern roundabout locations**

## Pedestrian crossings

One of the most frequent comments received from members of the public was that crossing Black Rock Turnpike is challenging, both in terms of the infrequency of crossings as well as the perceived lack of safe and comfortable accommodations. A priority for this corridor

plan was to improve conditions for all people using the Turnpike, and to the extent possible, lessen the need for cars to make short trips.

Although the sidewalks along the Turnpike are generally in good shape, and crosswalks exist at signalized intersections, the overall feeling from pedestrians was that designated crossings are too infrequent and are not always located at places people wish to cross. In the following figure, the four locations that were deemed to need enhanced pedestrian accommodation are shown. They are:

1. At the Tahmore Drive intersection – shorten crosswalks and include them on all four legs with an exclusive pedestrian signal phase
2. Between Old Navy and Trader Joes's – Reduced travel lanes and a median refuge island, combined with a high visibility crosswalk and HAWK signal
3. Between Shop Rite and CVS – High visibility crosswalks
4. At the Tunxis Hill Cutoff intersection – new pedestrian crosswalks integrated with the proposed roundabout

**Figure 27: Enhanced pedestrian crossing locations**

## Intersection modifications

For intersections that remain signal controlled, modifications are proposed to enhance operations corridor wide. Many of the recommendations provide dedicated left and/or right turn pockets to provide safer and more efficient use of intersection capacity.

Additionally, separate closed loop coordination systems on Black Rock Turnpike are provided for the intersections from Tahmore Drive to Fairfield Woods Road; and from the Turnpike Shopping Center and Fairway Plaza Driveways to Burroughs Road. All intersections were adjusted for optimized splits, cycle lengths and offsets.

**Figure 28: Intersection modification locations**

## Access Management

The high number of driveways along Black Rock Turnpike creates significant safety challenges because the road is designed to facilitate vehicular mobility but also serve access to the numerous residential and commercial properties adjacent to the road. This is of concern because curb cuts (driveways) increase conflicts between higher speed through traffic and slower speed drivers turning in and out of parking lots.

In addition to the location of a high concentration of curb cuts between Stillson Road and Burroughs Road, people expressed concern over the Old Navy plaza and Trader Joe's driveways between Fairfield Woods Road and Stillson Road. Crash data at this location indicated that this area experiences the greatest number of driveway-related crashes in the corridor.

During the online public survey, many respondents stated that the high number of driveways contributed to a stressful driving environment as turning traffic causes some drivers to abruptly change lanes. Public comments expressed a desire for the project to consider cross property connections wherever feasible.

Access Management is the proactive management of property access points to promote safer and more efficient traffic operations. The approach of this project with regards to access management was to:

1. Establish opportunities for cross-property connections wherever possible,
2. Eliminate redundant access points on single parcels whenever feasible,
3. Restrict access of driveways to right-in or right-out to minimize risky left-turning movements.

Appendix C details the access management recommendations for the corridor in greater detail. As Black Rock Turnpike continues to be developed over time, this plan can serve as a guide for the Town of Fairfield to use when dealing with property owners and the CT Department of Transportation. While making access modifications can be challenging and take many years, it is one of the more cost effective and beneficial solutions to addressing safety and congestion in the corridor.

**Figure 29: Locations for access management**

## Parking lot circulation

While not part of the public right of way, parking lots adjacent to Black Rock Turnpike can influence safety and operations along the corridor. Good parking lot design allows vehicles to enter and exit safely, without blocking intersections. They should also be designed to protect pedestrians by minimizing conflicts with other vehicles. Parking lots also offer an opportunity to reduce the number of driveways by providing good internal circulation and access across adjacent properties. As traditional brick and mortar retail continues to evolve over time, and as new car technologies gain adoption, the conventional wisdom that governs parking demand is sure to change. As this happens, property owners should consider modifying their parking lots to support the access management recommendations in this plan. Some initial ideas for modification of parking lots at Stillson Plaza, Enterprise 3 Shopping Center, and the Turnpike Shopping

Center were explored; however, more detailed engineering would need to be performed in the future.

**Figure 30: Parking lot modification locations**

Modifications to the main access at the Turnpike Shopping Center is recommended. Observations by community members and the project team indicate queuing challenges at the intersection, even while the traffic model suggests adequate Level of Service. Direct observation and comments from the public pointed to issues with the driveway and lot design which prevents the traffic signal from operating efficiently. This is largely due to three reasons: 1) the presence of an existing raised driveway apron requiring vehicles to slow as they proceed over the apron, 2) the lack of sufficient driveway throat length which causes vehicles to spill into the intersection, and 3) the limited storage for vehicles waiting to exit the shopping center. The following figure includes some ideas for alleviating these issues.

**Figure 31: Driveway and parking lot recommendations for Turnpike Shopping Center**

The Enterprise 3 Shopping Center represents smaller parcels without direct access to a traffic signal – meaning that vehicles traveling southbound must make a left-turn onto the turnpike at one of the several unsignalized driveways in this area. Enhancing and formalizing the connections to the parking lot behind the Enterprise 3 Shopping Center and associated properties is a key recommendation for facilitating good access management on the Turnpike. Figure 32 shows some ideas for cross-property connections and access management recommendations for this series of parking lots.

**Figure 32: Driveway and parking lot recommendations for 2120 Black Rock Turnpike (Mobil) and 1968 Black Rock Turnpike (CVS)**

At Stillson Plaza, the construction of a modern roundabout would require property that would impact the number of parking spaces that are currently provided. As the roundabout is intended to significantly improve access in and out of the plaza, circulation within the parking lot should be redesigned to improve both safety and efficiency of space. In the following figure some initial ideas for reallocating parking and providing logical circulation patterns are provided for future consideration.

**Figure 33: Driveway and parking lot recommendations for Stillson Plaza**

## Recommended Concept Plan

Table 2 and the corresponding figures on the following pages present the recommended corridor concept plan for Black Rock Turnpike in its entirety. The plan is drawn to scale and reflects a level of accuracy consistent with planning/pre-engineering studies. Future implementation of the recommendations will require more detailed design engineering; however, the plan that follows is sufficient for assuring general project feasibility and reasonable cost estimates.

All figures are sequential, starting at the northern end of the study area and progress south. All figures have match lines to indicate where the next image matches with the prior.

Figures 34 to 39: Recommended Concept Plan

Figures 34 to 39: Recommended Concept Plan

Figures 34 to 39: Recommended Concept Plan

Figures 34 to 39: Recommended Concept Plan

**Figures 34 to 39: Recommended Concept Plan**

## Near-Term Plan

The Recommended Corridor Concept Plan is a complex project overall and would likely require multiple construction seasons to complete. The entire project would need to be constructed in phases to minimize disruption to businesses and the traveling public, not to mention funding is unlikely to be obtained all at once. For these reasons, a Near-Term Plan was developed which includes several improvements from the Recommended Corridor Concept Plan that provide a high level of safety benefit for a lower overall cost. This Near-Term Plan can be considered the initial phase of the project.

The key differences between the Recommended Corridor Concept Plan and the Near-Term Plan are as follows:

- No recommendations between Tahmore Drive and Brookside Drive;
- Instead of a modern roundabout at the Black Rock Shopping Center and Stillson Plaza driveways, a raised median is included along with an enhanced pedestrian crossing;
- No dedicated right turn pockets on the Stillson Road approaches to Black Rock Turnpike.

The important elements of the Near-Term Plan are the single lane approaches to the corridor. In the southbound direction, just north of Brookside Drive, one of the two through travel lanes terminates to an exclusive left turn pocket. The single through lane extends to just north of the Stillson Avenue intersection. This recommendation is important for reducing the heavy turn conflicts at Brookside Drive and Fairfield Woods Road, and encouraging slower vehicle speeds through this segment of the corridor.

In the northbound direction, the installation of a modern roundabout at the Tunxis Hill Cutoff establishes a strong gateway feature at the

transition area between residential and commercial land uses. The roundabout improves operations at this intersection, but more importantly, allows for a single northbound lane to be carried through Katona Drive. By utilizing dedicated turn pockets and maintaining a single through lane, vehicle speeding is discouraged and risky lane changing behavior minimized. Due to the number of severe crashes in this area, several involving vulnerable users, speed control measures are highly recommended.

The table on the following page, and the subsequent illustrations, provide more details about the Near-Term Plan.

## 7. ANALYSIS

This chapter summarizes the traffic assessment that was performed for the Recommended Corridor Concept Plan developed for the Black Rock Turnpike Corridor Study. Detailed tables, figures, and traffic model reports can be found in Appendix D.

### Recommended Corridor Concept Plan Traffic Assessment

The Study Team analyzed the 2040 Background Traffic Volumes on a revised traffic network that reflected the conceptual improvements to the study area intersections and roadways. It incorporated extensive physical changes to the corridor as well as changes to the traffic signal settings. From a traffic capacity standpoint, the major changes are as follows:

- Modification to the lane use on the main line, side street, and driveway approaches to provide a single Black Rock Turnpike through lane where possible to calm traffic flow and increase traffic safety
- Construction of a modern roundabout at the Old Navy and Trader Joe's Plaza Driveways
- Construction of a modern roundabout at the Tunxis Hill Cutoff Intersection and realignment of Moritz Place to be a two-way stop controlled intersection
- Provide separate closed loop coordination systems on Route 58 (Black Rock Turnpike) for the intersections from Tahmore Drive to Fairfield Woods Road and from the Turnpike

Shopping Center and Fairway Plaza Driveways to Burroughs Road

- Optimization of the study area intersection splits within existing minimums
- Optimization of the intersection/network cycle lengths and associated offsets

A high-level summary of the expected traffic operations under the Recommended Corridor Concept are provided below. Improvements in the plan target capacity issues where possible, but operational efficiency is balanced with other safety benefits. The following operating conditions were identified from the analysis:

- Overall intersection LOS maintained an acceptable LOS C or better with the exception of the Black Rock Turnpike at Route 135 (Stillson Road), which operates at overall LOS D in the morning, afternoon and Saturday midday peaks.
- Movements and approaches operate acceptably at LOS D or better, with the exception of the following movements, which operate at LOS E during the identified peak hour:
  - Brookside Drive Left Turns in the afternoon
  - Fairfield Woods Road Through-Left Movements in the midday, afternoon, and Saturday midday and Fairfield Woods Road Right Turns in the afternoon and Saturday midday
  - Black Rock Turnpike at Stillson Road - Black Rock Turnpike Northbound and Southbound Left Turns in the afternoon and Saturday midday

For these specific approaches (previous page), the safety improvements and/or the optimization of the traffic signal timing for the forecasted 2040 volumes reduce the operational efficiency for these select approaches in favor of the Black Rock Turnpike main line through movements.

- Design queues for the Black Rock Turnpike Northbound Through-Right Movements at Katona Drive extend beyond available storage during the Saturday midday peak due to the reduction of a through travel lane on Black Rock Turnpike.
- In addition to the queues that extend beyond available storage, there are select movements that experience queues that are within available storage, but extend over approximately 500 feet due to the proposed improvements, including:
  - Black Rock Turnpike at Tahmore Drive – Black Rock Turnpike Southbound Approach in the morning, afternoon, and Saturday midday
  - Black Rock Turnpike at Samp Mortar Drive – Black Rock Turnpike Southbound Throughs in the afternoon and Saturday midday
  - Black Rock Turnpike at Burroughs Road – Black Rock Turnpike Northbound Through-Left in the morning, afternoon, and Saturday midday

## 8. IMPLEMENTATION PLAN

Following the initiation of a project and identification of a funding source, the remaining steps to implement an improvement will involve detailed design and construction. Based on the complexity of a project, an initial Preliminary Engineering phase may be required to conduct a more detailed engineering study and refine the concept plans and project scope. A preliminary engineering study can help establish the potential impacts to environmental and natural resources, identify potential property and utility impacts, and help refine the expected costs in current dollars rather than forecasting based on estimates reported in this Study, which are provided in current, 2018 dollars. There would also be continued public engagement throughout the design process.

Once Preliminary Engineering is complete and the decision is made to move forward with a project, final design will take place to add detail to the plan, conduct a right of way acquisition process, address utility conflicts and possible relocations, and develop construction documentation to facilitate bidding and construction of the improvements. Generally, projects that are identified as having a low level of complexity can be designed within 12-18 months from initiation of the project by the Towns. As complexity grows, so does the timeframe required to design improvements. Design phases can potentially last three years or more for highly complex projects. The following sections detail the permitting and compliance issues that will need to be incorporated during the design processes.

### Permitting and Compliance

The following sections detail the various permitting and compliance activities that need to be considered as the Study recommendations move into the design and implementation stages. Each section describes the purpose and need for the permitting/compliance

activity as well as the locations where they need to be considered. Included are sections on Environmental Permitting, Federal Funding and Preservation Compliance, Stormwater Permitting, and CTDOT Construction and Development Permitting.

#### Environmental Permitting

Improvement projects should assess natural resources within the project area study area including, but not limited to: 1) Threatened and Endangered Species and Critical Habitats, 2) Floodplains, and 3) Wetlands. Work proposed within these mapped resource areas would likely require obtaining permits from local, state, and federal regulatory entities. The environmental permits anticipated for the conceptual improvements are described in the following sections. Funding sources also play a role in which environmental permits may be required for future work.

#### *Threatened and Endangered Species and Critical Habitats*

The Threatened and Endangered Species information is available through the CTDEEP Natural Diversity Data Base (NDDDB). There is one NDDDB area mapped within the study area in the vicinity of the Mill River Crossing (NDDDB map provided in Appendix E). Improvements proposed within the mapped NDDDB areas will be required to coordinate with CTDEEP to determine what species may be affected by the project and any preventative or mitigative measures needed in the project design/schedule/approach. To request an NDDDB state listed species review, the NDDDB review request form package must be completed and submitted to CTDEEP. NDDDB mapping is updated on an annual basis, so projects should be re-screened if they move forward in the future. As such, the improvements to the Black Rock Turnpike at Tahmore Drive may require a NDDDB review request.

Preparation of a NDDB form submittal is estimated to take approximately two weeks, with an estimated agency review time of one to three months.

### *Floodplains*

Floodplains are limited to the areas adjacent to and feeding the Mill River in the northern end of the study area (Federal Emergency Management Agency (FEMA) Flood Insurance Rate Maps (FIRM) maps provided in Appendix E). Improvements proposed within the mapped floodway and 100-year floodplains will be required to obtain a Flood Management Certification approval. Areas of 500-year floodplain also exist within the study area, and these will need to be considered during design and permitting. It is assumed that since the work is proposed on state roadways, that state funding would be used, and the applicant for permits would be CTDOT. Depending upon the impacts and extent of the work, this permit could be a CTDEEP Individual Flood Management Certification or CTDOT Flood Management General Certification (CTDOT applicant and minimal impacts). Based upon a review of the mapping, only the improvements to the Black Rock Turnpike at Tahmore Drive intersection may require floodplain permitting.

Preparation of a Flood Management permit package is estimated to take approximately six weeks, with an estimated agency review time of four to six months. If CTDOT is the permit applicant, there would be no municipal floodplains permits required.

### *Wetlands*

There are mapped wetlands surrounding the Mill River as described in the Floodplains section above and along smaller streams, ponds, and wet areas within the study area. To determine if a project requires a wetlands permit, wetlands must be delineated in the field by a professional soil scientist, as well as waterbodies and watercourses. For purposes of this study, concepts within mapped

wetland areas, waterbodies or watercourses have been identified as having the potential for wetland permitting needs.

Based upon the review of the study area, it is expected that only the improvements to the Black Rock Turnpike and Tahmore Drive intersection may require wetlands permitting and impact to the wetlands is likely to be limited. In addition, it is unlikely that the wetlands located to the north and west of Katona Drive Extension and Burroughs Road and those located northwest of the Black Rock Turnpike and Samp Mortar Drive intersection will be impacted by the proposed improvements. Notwithstanding, the following is provided to give a general overview of wetlands permitting requirements should any wetlands be impacted by the proposed improvements.

Improvements proposed within the mapped wetland resource areas have the potential to be required to obtain an Inlands Wetlands and Watercourses permit through CTDEEP. If there are activities that alter or fill wetlands or watercourses, a United States Army Corps. of Engineers (USACE) Section 404 permit would be required. Generally, for USACE Section 404 approval, if impacts are less than 5,000 square feet (sf), then submitting a Self-Verification (SV) form to USACE would be needed. If impacts are greater than 5,000 sf and less than one acre, then a Pre-Construction Notification (PCN) would be needed. If the extent of the work within wetlands and watercourses causes greater impacts than one acre, an individual Section 404 permit would be required. Authorization would likely be through General Permit (GP) No. 18, however, if authorization under a different GP was required, then thresholds may be different than those outlined above.

In addition to the USACE Section 404 permit, a Water Quality Certification (WQC) approval under Section 401 of the Federal Clean Water Act would be needed. If authorization under GP 18 is sought, WQC approval would be granted as part of the SV approval process, if SV applies to the project. If the PCN is being sought and the project

has under 0.5 acres of impact, the CTDEEP Connecticut Addendum Army Corps of Engineers General Permit State of CT (CT Addendum) would be required for the WQC. If impacts are over 0.5 acres, an individual WQC through CTDEEP would be required. If USACE Section 404 approval were through a GP other than GP 18, then Section 401 WQC thresholds may change. If a USACE Section 404 permit is needed, the CTDEEP General Permit for Water Resource Construction Activities will also apply if the project has under one acre of wetland and watercourse impacts.

If CTDOT is the permit applicant, there would be no municipal wetlands permits required, as CTDOT coordinates with the municipalities during the design process.

Preparation of the SV form submittal is estimated to take approximately two weeks, with no agency review time. Preparation of the PCN, General Permit for Water Resource Construction Activities permit, and/or CT Addendum packages are estimated to take approximately six weeks, with an estimated agency review time of four to six months. Preparation of Individual USACE and/or Individual WQC permit packages are estimated to take approximately twelve weeks, with an estimated agency review time of eight to twelve months.

### Federal Funding and Preservation Compliance

Depending upon the funding source for projects, federal and/or state-level environmental documentation would be required. If federal funding is used, and if impacts are minimal, a Categorical Exclusion (CE) would likely satisfy the federal requirements. If the project has federal funding and greater impacts are anticipated, then the preparation of an Environmental Assessment (EA) may be necessary. If state funding is involved, to satisfy Connecticut Environmental Policy Act (CEPA) state environmental documentation requirements, a Post Scoping Notice or an Environmental Impact

Evaluation (EIE) would be required. As the project advances into conceptual design and additional project details are known, a determination should be made about the applicability of NEPA and CEPA and the proper class of documentation. Opportunities for streamlining the environmental documentation process should be used, if available (e.g., preparation of a combined NEPA/CEPA document).

If federal funds are used for the improvements, the project would be subject to Section 4(f) of the US Department of Transportation Act to determine if the improvements would have any impact to publicly-owned public parks, recreation areas, and wildlife or waterfowl refuges, or any publicly or privately-owned historic site listed or eligible for listing on the National Register of Historic Places. Similarly, Section 106 of the National Historic Preservation Act requires that federal agencies consider the effects of their actions on properties listed in, or eligible for listing in, the National Register of Historic Places. A review shows that Whitewood Knoll is the only park located within the study area and there are no listed sites on the National Register of Historic Places or within the Town of Fairfield list of Historic Properties. As such, the improvements to the Black Rock Turnpike at Tunxis Hill Cutoff, Moritz Place, and Whitewood Drive may require a review for compliance with Section 4(f). As the improvements are advanced into conceptual design and additional project details are known an assessment should be undertaken to determine what documentation is required in order to comply with Section 4(f) of the US Department of Transportation Act and consultation should be conducted with the CT State Historic Preservation Office to determine if there will be any impacts to historic places.

### Stormwater Permitting

It is unknown which concepts and segments will be constructed together, however if the soil disturbance proposed for a project is

over one acre, a CTDEEP General Permit for the Discharge of Stormwater and Dewatering Wastewaters from Construction Activities (Stormwater GP) would be required. With CTDOT as the applicant, this project would be classified as a locally exempt project. Any concepts that require the Stormwater GP, even if located outside of a mapped NDDDB area, must also request the NDDDB review and include the CTDEEP response in the stormwater permit package.

Preparation of the Stormwater GP package is estimated to take approximately six weeks. This permit filing must be submitted to CTDEEP 60 days before the start of construction if the soil disturbance area is between one and twenty acres. If the project's soil disturbance is greater than 20 acres, the permit should be submitted 90 days before the start of construction. CTDEEP has the 60- or 90-day timeframe to review the filing and provide any feedback to the applicant.

If CTDOT is the permit applicant, there would be no municipal stormwater permits required. If soil disturbance for the project is less than one acre, and a CTDEEP wetlands permit is required, no municipal stormwater permits would be needed.

#### *CTDOT Improvement Construction & Development Permitting*

In addition to the permitting for natural resources, CTDOT will require permits for developments and construction of improvements within the State right-of-way for Municipal roadway improvements and driveways to developments that are not included within the scope of a CTDOT project. The permits include encroachment permits and signal revision permits for any Municipal roadway and development driveway improvements and Office of State Traffic Administration (OSTA) permits for revisions to large developments that exceed the OSTA size limits and or those that are currently certified by OSTA. Depending on the scope of the work and the entity,

the Municipality or a private developer performing the design, funding for the permits may come from public and/or private resources.

## Construction & Opinions of Probable Construction Cost

Following the completion of the design phase, the projects will begin the construction phase. The steps involved in a publicly funded project include advertisement for bids to contractors, collecting bids on the work and awarding the contract, and finally conducting the construction to build the improvement. Utility relocations typically take place during construction, but in some instances a utility company may relocate facilities in advance of a project taking place once a utility agreement is in place. Generally, smaller projects are completed within one construction season between March and November. Larger projects can span several construction seasons depending on the complexity of the work, the construction staging and phasing needed to facilitate the maintenance and protection of traffic operations during construction, and possibly the availability of funding. Projects identified as having Moderate Complexity can be expected to take up to two construction seasons and highly complex projects could take more than two construction seasons to build.

To assist in the budgeting of funding for the improvements, opinions of preliminary probable construction costs (OPC) were developed for the Recommended Corridor Concept. The preliminary costs have been estimated following the guidelines published by the CTDOT and are presented in 2019 dollars. Project costs may require inflation factors looking out into the future to determine actual funding needs for funding programming. The "Preliminary Cost Estimating Guidelines" provide unit costs and percentage based lump sum costs to facilitate the estimation of project costs at the Preliminary

Engineering level of project development. The approximate project costs presented in this Study are limited to the construction item costs and exclude costs related to rights of way actions and environmental remediation, and engineering. The estimates include contingency (25%) and incidentals (25%) in the total opinion of probable costs.

As shown in Table 4 below, the improvements outlined in the Recommended Corridor Concept are estimated to cost approximately \$23.1 million to construct. Table 5 lists the estimate costs for the Near-term Plan, which comes to about \$10.1 million. The tables also present estimated construction costs for each intersection area to allow for estimates for projects including multiple intersections. The full OPC for each intersection including items, quantities, and unit costs are provided in Appendix F.

**TABLE 4**

Opinion of Probable Construction Cost Summary – Recommended Corridor Concept

| Intersection                                                       | Opinion of Probable Construction Cost |
|--------------------------------------------------------------------|---------------------------------------|
| 1 Black Rock Turnpike at Tahmore Drive & Old Black Rock Turnpike   | \$360,000                             |
| 2 Black Rock Turnpike at Samp Mortar Drive                         | \$2,273,000                           |
| 3 Black Rock Turnpike at Brookside Drive and Fairfield Woods Road  | \$2,288,000                           |
| 4 Black Rock Turnpike at Lake Hills & Black Rock Shopping Centers  | \$3,817,000                           |
| 5 Black Rock Turnpike at Route 135 (Stillson Road) & Stillson Road | \$2,327,000                           |
| 6 Black Rock Turnpike at Turnpike Shopping Center & Fairway Plaza  | \$1,139,000                           |
| 7 Black Rock Turnpike at Katona Drive & Katona Drive Extension     | \$3,523,000                           |

|                                                                                    |                     |
|------------------------------------------------------------------------------------|---------------------|
| 8 Black Rock Turnpike at Burroughs Road                                            | \$2,675,000         |
| 9 Black Rock Turnpike at Tunxis Hill Cutoff, Route 732, Mortiz Pl. & Whitewood Rd. | \$4,746,000         |
| <b>Total</b>                                                                       | <b>\$23,148,000</b> |

**TABLE 5**

Opinion of Probable Construction Cost Summary – Near-Term Concept

| Intersection                                                                       | Opinion of Probable Construction Cost |
|------------------------------------------------------------------------------------|---------------------------------------|
| 1 Black Rock Turnpike at Tahmore Drive & Old Black Rock Turnpike                   | \$360,000                             |
| 2 Black Rock Turnpike at Samp Mortar Drive                                         | \$0                                   |
| 3 Black Rock Turnpike at Brookside Drive and Fairfield Woods Road                  | \$1,471,000                           |
| 4 Black Rock Turnpike at Lake Hills & Black Rock Shopping Centers                  | \$967,000                             |
| 5 Black Rock Turnpike at Route 135 (Stillson Road) & Stillson Road                 | \$330,000                             |
| 6 Black Rock Turnpike at Turnpike Shopping Center & Fairway Plaza                  | \$521,000                             |
| 7 Black Rock Turnpike at Katona Drive & Katona Drive Extension                     | \$942,000                             |
| 8 Black Rock Turnpike at Burroughs Road                                            | \$761,000                             |
| 9 Black Rock Turnpike at Tunxis Hill Cutoff, Route 732, Mortiz Pl. & Whitewood Rd. | \$4,746,000                           |
| <b>Total</b>                                                                       | <b>\$10,098,000</b>                   |

| 1 | We need a traffic light at the intersection of BRT and Nonopoge Road.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| 2 | Left Turns: prohibit Left turns except at intersections.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 3 | We need a traffic light at BRT and Nonopoge Road                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| 4 | Hello, I support the proposed plans and encourage any change that will make the Black Rock Turnpike safer for pedestrians. We live in walking distance of the stores and would love the addition of crosswalks.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 5 | <p>Hi, I attended the presentation on Nov. 5th. I thought everyone that presented did a thorough, informative easy to understand presentation.</p> <p>I've lived in Fairfield for 26 years. I work locally and crossover Black Rock Tpke/Stillson road daily. I frequently shop and visit many merchants.</p> <p>I do not agree with installing roundabouts on Black Rock Tpke. I have many concerns:</p> <p>Having crosswalks without traffic signals is unsafe for pedestrians to cross such a high traffic roadway. It will also frustrate drivers as some pedestrians mistakenly believe they have the right away.</p> <p>I also feel that the confusion with the roundabouts will push traffic onto the side roads.</p> <p>I do not believe Roundabouts belong on such a busy roadway. I can't imagine senior and new drivers figuring out this new way.</p> <p>Many will avoid shopping/traveling in this area.</p> <p>They do not fit in our community.</p> <p>Cost of the roundabouts. Who will pay for all of this?</p> <p>There's a roundabout in Riverhead, NY that I believe will be similar to the proposed Black Rock Tpke ones. We found it to be very confusing, and scary when you pull in. Busy roadway, similar to Black Rock tpke.</p> <p>thanks for your time</p> |
| 6 | Thank you but you can take me off your email list....I hope to move soon so no more interest in this. No way bike riding will ever happen around there as so dangerous.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| 7 | <p>The left hand turn from Tunxis Hill to South Bound Black Rock turnpike is terrible. Why not put a proper intersection light system there. A round about is a horrible idea due to the volume and size of the vehicles on that road.</p> <p>The circle near Staples is pitiful and has probably lead to millions of dollars in insurance claims. Someone should research the amt of insurance \$ spent here each year. I don't know what kind of engineers you hire, but the new lines are worse than the others, they creat lanes that come from nowhere and end nowhere. It is an extremely dangerous free-for-all.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| 8 | People in Fairfield don't care much about Black Rock, which is Bridgeport.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

|        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| 9      | <p>Thank you for your work on this project. The team clearly developed thoughtful recommendations on this challenging major roadway in town. I was not at the latest presentation, but I have reviewed the materials on the website.</p> <p>In the past, I had always believed I'd rather not live near BRT and as a result, have to use that roadway for goods and services. Alas, I do now reside in the Stratfield area of town and find myself navigating BRT regularly.</p> <p>I am in favor in general of several of the proposed recommendations. The areas where medians and better pavement markings are proposed to direct traffic flow and turning opportunities, combined with closing of a number of curb cuts/driveway openings, I believe would be a vast improvement over existing conditions. I believe the roundabouts are also the right approach. They offer traffic calming measures, improvements for pedestrians, and better traffic flow.</p> <p>The roundabout at Tunxis Hill Cutoff would seem to be a "no-brainer" as it will clean up a rather unusual intersection with traffic approaching from many different directions. The other two proposed roundabout areas, while perhaps more difficult to develop due to private property encroachments, also seem to be big improvements over existing conditions.</p>                                                                                                                                                                                                                                                                                                                                                                                                                        |
| 9-cont | <p>Was a roundabout considered for the Burroughs intersection? As you are aware, that has been a particularly unsafe intersection, in part due to the grade change, low visibility to the east, and speed of motorists.</p> <p>For pedestrian improvements, more and better crosswalks are a must as indicated in your proposal. I did not see recommendations regarding proposed sidewalk widths and adding new sidewalks where appropriate. Hopefully, more can be considered.</p> <p>Also, while I understand the survey results suggest an unfriendliness towards bicycles, I do believe it is important to make improvements that factor in cyclists. Cyclists, at the moment, simply avoid BRT, and with good reason. A better designed roadway should be safer for cyclists. Also, considerations for cyclists to cross BRT should be factored in. There is a new bike route that crosses BRT at Burroughs and there could be future routes that either cross BRT or use part of BRT on the route (I am currently a member of the Fairfield Bicycle and Pedestrian Committee, although admittedly I am not much of a cyclist myself).</p> <p>Additionally, I did not notice many improvements for transit riders, except for the pull-out near Old Navy. Were other improvements specifically for transit riders considered and determined not necessary? Better placement of bus stops, better shelters perhaps?</p> <p>Lastly, you have probably been made aware of a recently approved Complete Streets Policy in town, but if not, it can be found at <a href="https://www.fairfieldct.org/news/?FeedID=2356">https://www.fairfieldct.org/news/?FeedID=2356</a>. This study certainly aligns with the Policy.</p> <p>Thank you for all of your efforts.</p> |

|           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| 10        | <p>I support the recommendations of this study as best I understand them. The analysis of the traffic and access problems for Black Rock Turnpike was well defined and logical. The proposed solutions seem to be innovative and reasonable. The solutions will better manage traffic flow on Black Rock Turnpike and will increase safety for drivers and pedestrians.</p> <p>However, the final presentation was not handled well and has left many questions. The primary area of concern is implementation. How this project would best be phased, what the priority elements are, the implications for implementing some but not all the elements of the plan were not presented in sufficient detail. Costs for phasing, how many years would be required for implementation, what traffic would look like during construction and other elements have not been presented to the community.</p> <p>I could not locate the "Realignment Scenarios Report, including conceptual plans for each improvement" that would be a useful resource for public evaluation of the recommendations.</p> <p>There was too much detail about the recommendations in the November 5 public meeting without sufficient time for questions and discussion from the public. At this point, there are many un-and-under answered questions, and there seemed to be unease amongst members of the public who were presented with an intricate plan without the ability to digest and comment on all its elements. Lack of attention to implementation left the clear impression that this is "just another study that will be filed away," as someone commented after the meeting.</p> <p>This project started out with a real effort to build community support via the survey, the Community Advisory Committee, and the efforts made to include the views of property owners and business operators on Black Rock Turnpike. The energy expended in developing a consensus in favor of the project appears to have dissipated based on the performance of the session presenting the findings to the public.</p> |
| 10 - cont | <p>A condensed version of the findings including a proposed implementation plan should be presented with a longer period for public comment and discussion at the end of the presentation. A presentation should also be made before the RTM with the Board of Finance and other relevant bodies asked to attend. If there is a real desire to implement this plan, a great deal more organized and focused outreach needs to occur.</p> <p>One area of the plan that does not appear to have received much consideration is mass transit. New bus shelters were noted, but should there be additional mass transit considerations? For instance, if people tend to visit more than one store when they go to Black Rock Turnpike, would a trolley that shuttles people to and fro along Black Rock Turnpike be useful? (Perhaps a commuter-like parking lot at the upper end of Black Rock Turnpike that would allow people to park and take a trolley would be useful.) Considering the heavy flow of traffic to and from Black Rock Turnpike in both directions on Stillson Road, would a shuttle from the Post Road to Black Rock Turnpike be useful and act as a low traffic link between the Town's two major commercial centers?</p> <p>In general, the issue of reducing traffic on Black Rock Turnpike does not appear to have been considered in any detail, a fact noted among members of the public after the November 5 meeting.</p> <p>Despite my concerns, the Black Rock Turnpike study reflects a great deal of highly professional and much appreciated work by the consultants and by Town staff.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

|           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 11        | <p>In general, I thought the recommendations were well thought out and desirable. I like all three roundabout ideas, particularly the two at Tunxis Hill and in front of Trader Joe's. Tunxis Hill will be helpful to reduce the speed entering the zone while at Trader Joe's there will be a speed reduction along that stretch of road and a significant reduction in left turns. The one problem area is the intersection in front of CVS and Shop Rite. I just doesn't work for everyone, pedestrians and left turning vehicles out of the parking lots, in particular. I'm not smart enough to suggest a workable alternative and hope you can come up with one.</p>                                                                                                                                                                                                                                                                                                                                                                                                   |
| 12        | <p>Basically... NO roundabouts.</p> <p>With the Town continually granting developments that will add horrendous traffic, you're beating a dead horse. Parking is becoming non-existent.</p> <p>My recommendation... Police presence and tell the Town to STOP creating traffic.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 13        | <p>Short term - lower cost - less disruptions</p> <p>Implement proposed pedestrian improvements</p> <p>Use Smart flashing red light to assist ped crossings</p> <p>Use Smart traffic signals. Add vehicle activated trips where advantageous</p> <p>Keep as much two lanes as possible for emergency vehicles.</p> <p>Drivers do not pull over fast enough now and with only one lane and no way to get around could be disastrous Car 3, Engine 2 and Ladder 2 use BRT as main route to Merritt Pkwy</p> <p>Section #1 Leave as is. Works now. Possibly add trips to both lanes northbound BRT</p> <p>Section #2 At Burroughs Rd on BRT add delayed left turn arrow southbound Use trips on both sides of Burroughs</p> <p>At Katona use trip on Katona Change left turn arrow to delayed northbound.</p> <p>Section #3 At SR and CVS Change current left turn arrow to delayed</p> <p>Add left turn arrow to enter SR</p> <p>Section #4 Stillson Leave alon. Works now.</p> <p>Section #5 Add GBT bus pull out. Change GBT RT 10 to use Stillson, Fairfield Woods, BRT</p> |
| 13 - cont | <p>Section #6 Fairfield Woods use delayed left turn arrow northbound, add delayed left turn arrow into Shopping Ctr</p> <p>Brookside use delayed left turn arrow</p> <p>Section #7 Samp Mortar Use trip on Samp Mortar</p> <p>Roundabouts may be used in future years if private businesses change and driveways get reconfigured, but that won't happen in short term.</p> <p>I would be happy to explain any of these comments since I am typing this with only minutes before your deadline for submission. and don't have time to really justify these item as well as other ideas I have.</p> <p>I have live within two blocks of BRT for forty years and have watched it develop.</p> <p>Thanks,</p>                                                                                                                                                                                                                                                                                                                                                                   |

|    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| 14 | <p>Dear Black Rock Turnpike Safety Study Team,</p> <p>So sorry I missed the 11/19 deadline. Even though I am late, please consider these easy-to-implement suggestions:</p> <ol style="list-style-type: none"> <li>1. Plant trees in all median dividers (as trees also help to slow traffic and beautify).</li> <li>2. Install public art and green-scaping to each roundabout (for both beautification and placemaking).</li> </ol> <p>Thank you for all of your hard work! Your proposed improvements will make this scary area much safer and more amenable to pedestrians.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| 15 | <p>Comments:</p> <ul style="list-style-type: none"> <li>* this study did a great job of community engagement,</li> <li>* phased implementation of recommendations seems very logical,</li> <li>* the study notes that the Greater Bridgeport Transit route is primarily used as a “destination,” but the study utterly fails to look at enhanced mass transit assets that might help mitigate Black Rock Turnpike congestion. A wheeled trolley service along Black Rock Turnpike starting and ending at parking lots at both “ends” of Black Rock Turnpike would enhance pedestrian safety since pedestrians could jump on and off at their desired destinations. This trolley service would also reduce vehicle traffic on Black Rock Turnpike. A second trolley that originated and terminated on the Post Road in Fairfield center would bring shoppers to and from Black Rock Turnpike. Some Fairfield residents who live in the southern part of Town hesitate to shop on Black Rock Turnpike due to traffic concerns. A trolley service would likely increase shoppers from the southern part of Fairfield to Black Rock Turnpike. Trolleys could provide transportation for bicycles. Distinctive trolleys would be a marketing asset as they are in many other towns and cities. Trolleys could be funded by a modest ridership fee, commercial sponsors, and federal grants.</li> </ul> |

# Stakeholder Comments on Preliminary Concept Plan

## Initial CTDOT comments on Preliminary Concept Plan

- DOT asks if we will have other speed reduction techniques besides roundabout- possibly more landscape medians (south of Burroughs and perhaps at entrance near Samp Mortar)
- Consider HAWK at mid-block crossing
- Consider truck movements to Dunkin, CVS and other plazas
- Consider turn pockets or other treatment to keep traffic moving at Burroughs
- Add left turn out between CVS and Bear & Grill
- Diagram how left turn traffic will work
- Make sure pedestrians are accommodated throughout

## Kleban Properties meeting 1189 Post Road, Fairfield, CT 9:00 AM – 11:00 AM

### Attending:

Ken Kleban, Evan Kleban, Deborah Koba - Kleban Properties

Matt Fulda, Meghan Sloan – Metro COG

Mark Barnhart, Jim Wendt – Town of Fairfield

Parker Sorenson, Mike Morehouse - FHI

- No comments on Tunxis Hill Roundabout
- ShopRite / CVS Area
  - Concern for exiting traffic to Black Rock Southbound
  - Concerns for queueing space for left-turning vehicles
  - Concern for access to bakery property and convenience uses for northbound vehicles on Black rock
  - Concern for access to ShopRite property for semi-trucks from I-95 from the south and need to use driveway near bakery
  - Like the concept for a reorganized parking lot with clearer aisles
  - Would like team to look into connecting ShopRite properties to properties to the north (towards Stillson Rd)
- Old Navy/ Trader Joe's Area
  - Like the concept for a roundabout to serve both these driveways (stated approval three times +)
- FFW / Brookside area
  - Concern for removal of FFW Driveway
- General:
  - Concern for emergency response – note that AMR Ambulance sits at Stillson near gas station
  - Tenants don't like occlusive bus shelters – but may be more amenable to sideless shelter
  - Would like to see more connections between properties in general

## Meeting with the First Selectman (Mike Tetreau) and his Chief of Staff

- Concern for ADA & crossings at locations that do not have signal control, especially at the roundabouts. He had concern that vehicles would not yield and have concern for the elderly citizens.
- Question on what traffic days this is modeled for. For example, will it still work during holiday peaks?
- Concern for the permanence of the improvements and need to state what these improvements won't fix and be upfront about this
- Chief of Staff (COS) raised concern for the vacant building on the east side to the north of the corridor – mentioned that traffic and access to driveway will limit uses here
- COS commented that improvements should focus on improvements to quality of Life
- Question on potential to have funding for parking lot connections through the state

## Technical Advisory Committee Comments

Thursday, October 26, 2018 at 2:30 PM

Old Town Hall Conference Room – 611 Old Post Road

Attendees:

| Name            | Organization                                                   |
|-----------------|----------------------------------------------------------------|
| Bill Hurley     | Engineering Manager, Fairfield                                 |
| Doug Holcomb    | CEO, Greater Bridgeport Transit (GBT)                          |
| George Obeng    | GIS Technician, MetroCOG                                       |
| Jim Wendt       | Assistant Planning Director, Fairfield                         |
| Mark Barnhart   | Director, Fairfield Office of Community & Economic Development |
| Matt Fulda      | Acting Director, MetroCOG                                      |
| Meghan Sloan    | Planning Director, MetroCOG                                    |
| Rob Kalamaras   | Fairfield Police                                               |
| Urb Leimkuhler  | Fairfield Senior Advocates & Human Services Committee          |
| Mark Cocoran    | Fairfield TPZ Committee                                        |
| Laura O'Brien   | Fairfield Bike / Ped                                           |
| Parker Sorenson | FHI                                                            |
| Craig Yannes    | Tighe & Bond                                                   |
| Mike Morehouse  | FHI                                                            |

- Doug Holcomb of GBT noted his support of the roundabout with a bus pull-out. The project team noted that the roundabout design is intended to be such that a bus does not have to use the truck apron. Doug Holcomb noted that this would lead to improved reliability and shorter turnaround time, while allowing GBT busses to wait for the return trip while not on a residential road
- Bill Hurley mentioned that crosswalks at Samp Mortar are in the process of being completed by the town.
- Doug Holcomb questioned the timeline of implementing the proposed concept. The estimated planning budget is \$23M, meaning that it would need to be scheduled in the TIP and funded.

Likely several years out. Doug replied that he is looking to put some bus shelters on the turnpike in the meantime.

- A Committee member raised concern for roundabout operation at Tunxis Hill and the Black Rock Turnpike. The member questioned access from the Black Rock Turnpike northbound entry. The member had concern for delay at this approach
- Committee members raised general concern for the short-term proposal and the thought that speed would not be adequately reduced between Stillson Road and Fairfield Woods Road. Several members noted that they would like to see the roundabout at Old Navy to be a second priority after a roundabout at Tunxis Hill.
- Several committee members expressed disapproval in the lack of pedestrian enhancements at Black Rock and Stillson Road intersection. Mike responded that this can be addressed with showing enhanced crossings and other minor modifications.

Route 58 Corridor Study  
Town of Fairfield  
Final Draft Report Review – CTDOT

FHI Team responses in yellow

1. Throughout the report Appendix A through D are referred to, but were not provided. If this was meant to refer to the Appendix in the Black Rock Turnpike Corridor Study Final Report Memo, the corresponding Appendices do not match. Please provide the Appendix for review.
  - a. These are provided in a separate document
2. A review of the Synchro analyses revealed that several instances where lag left-turn phasing was proposed. The Department prefers lead left-turn phasing.
  - a. The lagging left was limited to the Brookside/Fairfield Woods Road intersection as it was in the existing condition due to the proximity of the two closely spaced intersections and the geometric concerns for SB lefts into Fairfield Woods. The lead/lag phasing can be considered during design phase.
3. Recommended Segment 1 (Figure 34): The southbound Route 58 approach at Tahmore Drive will experience nearly 1200 foot queues in the 2040 afternoon peak improved conditions. Is this acceptable to the Town?
  - a. The 2040 concept keeps current geometrics, however recommends signal coordination at Tahmore with the rest of the corridor and the increase in cycle length to 110 seconds versus the current 75 seconds. This change allows this intersection to give a higher split percentage compared to the 2040 background condition (proposed = 85% versus current = 73%). This means that the 2040 Concept performs better in the southbound direction than the 2040 background condition. For example, expected delay in SB direction under the proposed concept is 53s compared to the 2040 background of 73 seconds. Also, it is noted that the Synchro model has this southbound leg coded as a single-shared left/thru/right lane. This means that in the LOS calculation, a waiting left-turning vehicle would prevent thru traffic to pass. The current configuration with an 8' shoulder allows vehicles to pass these left-turning vehicles, meaning that actual conditions may operate better than suggested by the Synchro model. For example, the 2017 existing conditions results show a design queue of 769 feet in the southbound direction, however, discussions with the Town suggest that these queues are not realized indicating that by-passing traffic may reduce queueing otherwise expected in this area.

4. Recommended Segment 2 (Figure 35): The southbound Route 58 approach at Samp Mortar Drive will experience nearly 800 foot queues in the 2040 afternoon peak improved conditions. Is this acceptable to the Town?
  - a. We compared the 2040 background to the 2040 concept queues. The 2040 concept queues (before signal retiming) in the southbound direction are 742' versus 2040 background of 293'; however, by increasing the cycle length at this signal (from 75 seconds to 110 seconds), and increasing the cycle split given to the southbound movement (from 29% to 55%) we can substantially mitigate queueing. The Synchro model shows that while queues of ~30 vehicles may form, the longer green-time given to the southbound direction over baseline conditions means that vehicles should be able to clear the intersection. Additionally, the recommendation to coordinate the Tahmore signal improves operations at this signal as well. In summary, operations should be substantially improved by the retiming of the signal as described. However, it will be expected that queues will develop during the afternoon peak, yet these are expected to be serviced within one cycle. In general, the operations appear to be satisfactory given the safety benefits expected to be realized with the proposed alignment. Future design phase can override this concept if the Town and State are uncomfortable with the anticipated operations.
5. Recommended Segment 2-3 (Figure 35/36): Is a 300 foot southbound Route 58 left-turn lane at Brookside Lane necessary? Was consideration given to providing a northbound Route 58 left-turn lane where there are more driveways on the west side of Route 58? In addition, it appears that it was analyzed as two southbound through lanes not a through lane and an exclusive left-turn lane. Which is correct?
  - a. We will shorten the turn pocket length and provide painted median space – which can potentially be used as a TWLTL and allow for left-turners to the driveways on the “western” side of Route 58.
6. Recommended Segment 3-4 (Figure 36/37): There is approximately 300 feet of storage for two lanes on southbound Route 58 between the proposed roundabout and Stillson Road (Route 135), was this taken into consideration in the Synchro analyses? The queues (50<sup>th</sup>/95<sup>th</sup>) during the PM and Saturday peaks extend over 300 feet.
  - a. CAD shows storage about 500' and should be sufficient for queuing
7. Recommended Segment 5 (Figure 38): For the Route 58 northbound approach at Katona Drive, should two through lanes be maintained instead of a through lane and an exclusive left-turn lane? The report indicated that northbound queues extend beyond the available storage during the Saturday peak. If the proposed configuration is to be maintained, why is a southbound Route 58 phase fixed advance proposed instead of providing a southbound left-turn lane where the mountable island is proposed?

- a. Max fixed was an issue within the file that doesn't not impact the results of the analyses. For safety reasons, a single through lane is preferred. High speed traffic with frequent lane changing is an issue and this area experienced several severe crashes, with three fatalities and a number of bicycle and pedestrian crashes.
8. Recommended Segment 5 (Figure 38): The alignment of the Route 58 northbound approach at Burroughs Road may increase the likelihood of same direction sideswipes due to the approach narrowing after the stop bar (22 feet to 19 feet). In addition, the report indicated that Route 58 northbound queues will extend over 500 feet, will this affect the operation of the proposed roundabout. Consideration should be given to maintaining two northbound through lanes.
- a. We will fix the visual of the cat tracks. There is enough storage for the queues extending to the roundabout.

If the proposed configuration is to be maintained, was a Route 58 southbound left-turn lane at Burroughs Road considered instead of a mountable island?

- b. Left-turn lane not provided due to 1) right turn swept path of trucks from Burroughs to Black Rock North bound and 2) shift required by through traffic (from left lane to right – though mitigated by intersection geometry) causes concern with providing this space for left-turning vehicles.

Will the business at 1817 Black Rock Turnpike be ok with the proposed mountable island restricting left-turns into their site from Route 58 northbound?

- c. We will emphasize that this median is not to be a raised due to this driveway as well as for accommodating truck right turns from Burroughs to BRT NB
9. Can the proper design vehicle navigate both proposed roundabouts?
- a. We tested the Tunxis roundabout and WB62 and 67's can make the turns. There may need to be some slight modifications and mountable islands, etc once the design is undertaken. For the Old Navy roundabout, the preliminary swept path for a left-turning WB 62 is shown below:

Swept path for through WB 62 for the originally proposed roundabout at Katona which had similar design. Design elements for buffer between sidewalk will likely need to be considered – but were successfully implemented in Glastonbury.

Left-turns for WB 62 at Tunxis Hill cut-off. This roundabout is larger (ISD = 130') which should be more than adequate for trucks.

Finally – the size of the Old Navy Roundabout should be designed to allow for GBT buses to U-turn without mounting the median. This roundabout should be adequately designed for this movement.

Materials design details are key. These roundabouts can be designed for trucks to be mount inside curb (e.g. Glastonbury Roundabout).

10. Near-term recommendations Segment 2 (Figure 41) only shows a single Route 58 southbound through lane approaching Samp Mortar Drive. Two lanes are existing today.

- a. This is correct. See answer to question 5. Town to decide on SB approach configuration during final design. Single lane was recommended for safety reasons.
11. Near-term recommendations Segment 3 (Figure 42): According to the MUTCD, a HAWK signal should be installed at least 100 feet from side streets and driveways that are controlled by STOP or YIELD signs. It appears that it is proposed directly adjacent to the Old Navy/Gap driveway which is stop controlled. Would RRFBs be a more appropriate treatment at this location for a short term solution? The cost of a HAWK signal is comparable to that of a traffic signal and may not be the most economical near-term solution.
  - a. HAWK signal within 100' from side-street guidelines could change in MUTCD, however a RRFB is also an option. Suggest revisiting this decision during final design.
12. Page 17 Figure 9: Locations of Crashes by Type and page 35 Figure 29: Locations for crash type are too small to interpret. Should be a whole page.
  - a. Ok, FHI to change.
13. The report and concept plans should clearly indicate where roadway widening is recommended.
  - a. With the exception of the Old Navy roundabout and the widening at Stillson, we've made every attempt to stay within curb to curb limits. There may be some sliver impacts in places, but the conceptual planning level of detail is not sufficient for precise determination of widening impacts. More extensive engineering and design phases will identify potential locations for widening.
14. Label each of the Figures 34 through 39 as Recommended Concept Plan. Label Figures 40 to 45 as Near Term Plan to distinguish between the two scenarios.
  - a. Ok, FHI to change.
15. Please note that all comments and markups on the Recommended Concept Plans (Figures 34 through 39) also apply to the plans in the Executive Summary (Figures ES-1 through ES-6).
  - a. Noted.

## BLACK ROCK TURNPIKE SAFETY STUDY

### APPENDIX B: PRELIMINARY CONCEPT PLAN

MAY 2019

# Section Key Map

# Section 1

## Issues

- A Challenging geometry  
High pedestrian activity  
Limited crosswalks
- B High vehicular speeds  
60-70% curbside lane utilization
- C Multiple fatal crashes  
High pedestrian activity

## Benefits of improvements

1. Roundabouts slow traffic and reduce travel lanes
2. Roundabouts reduce frequency and severity of crashes
3. Additional pedestrian crossings provided

## Remaining issues

1. Roundabout requires shift to allow for parking circulation at plaza near Judd Street
2. Wetlands/watercourse behind Anytime Fitness + may preclude Katona Street connection
3. Strategies to mitigate spillover from southbound vehicles queued at Burroughs

# Section 2

## Issues

- D Substandard sight lines  
High pedestrian activity  
Shoprite parking lot causes congestion
- E Numerous curb cuts/turn-related crashes
- F Highest crash location in corridor  
High pedestrian activity/Long crossing distance
- G Excessive vehicular queuing

## Benefits of improvements

1. Lane reductions allow for protected pedestrian crossing between Shoprite and CVS
2. Lane reductions reduce speed and uncontrolled intersection conflicts
3. Bus pullouts provided where needed most
4. Medians eliminate left-turn conflicts
5. Roundabout and median U-turn allow for safer ingress/egress into properties

## Benefits of improvements continued

1. Right turn lane and extended left turn lane on Stillson EB approach reduces queuing
2. Right turn lane on Stillson WB approach reduces queuing

## Remaining issues

1. Relocated driveway to Shoprite requires parking reconfiguration
2. Taper length of receiving lanes on Black Rock Turnpike southbound may be insufficient
3. Widening along Stillson to accommodate turn lanes might have property and/or sidewalk impacts

# Section 3

## Issues

- H High NB speeds/Numerous curb cuts
- I Highest unsignalized crash location (left-turns)  
High pedestrian desire line  
No midblock crossing available
- J High SB speeds
- K Grade and sight line issues on Fairfield Woods  
High crash location
- L 70-80% curbside lane utilization

## Benefits of improvements

1. Roundabout slows traffic and reduces SB travel lanes/Reduces frequency and severity of crashes
2. Additional pedestrian crossings provided
3. Left turn lanes formalize existing turn movements
4. SB lane reduction lowers speed/normalizes flow
5. Medians control property ingress/egress
6. Bus pullout eliminates layover on FF Woods

## Remaining issues

1. Roundabout requires property impacts and net parking loss
2. Roundabout requires double lane NB
3. No lane reduction NB due to heavy traffic volume
4. Close spacing between Brookside and FF Woods
5. Relocation/consolidation of FFW Plaza and Duchess necessary for lane reduction and improved operations at FF Woods

## BLACK ROCK TURNPIKE SAFETY STUDY

# APPENDIX C: ACCESS MANAGEMENT RECOMMENDATIONS

MAY 2019

## Access Management

The high number of driveways along Black Rock Turnpike creates significant safety challenges because the road is designed to facilitate vehicular mobility over access. As identified in the existing conditions report, there are approximately 52 commercial curb cuts across the two-mile study corridor, with a particularly high number of driveways located between Stillson Road and Burroughs Road. This is of concern because additional curb cuts increase conflicts between higher speed through traffic and slower speed drivers turning in and out of parking lots.

In addition to the location of a high concentration of curb cuts between Stillson Road and Burroughs Road, people expressed concern over the Old Navy plaza and Trader Joe's driveways between Fairfield Woods Road and Stillson Road. Crash data at this location indicated that this area experiences the greatest number of driveway-related crashes in the corridor.

During the online public survey, many respondents stated that the high number of driveways contributed to a stressful driving environment as turning traffic causes some drivers to abruptly change lanes. Public comments expressed a desire for the project to consider cross property connections wherever feasible.

Access Management is the proactive management of property access points to promote safer and more efficient traffic operations. The approach of this project with regards to access management was to:

1. Establish opportunities for cross-property connections wherever possible,
2. Eliminate redundant access points on single parcels whenever feasible,
3. Restrict access of driveways to right-in or right-out to minimize risky left-turning movements.

The following sections detail the access management recommendations for the corridor. As Black Rock Turnpike continues to be developed over time, this plan can serve as a guide for the Town of Fairfield to use when dealing with property owners and the CT Department of Transportation. While making access modifications can be challenging and take many years, it is one of the more cost effective and beneficial solutions to addressing safety and congestion in the corridor. The following legend may be referred to for subsequent figures.

### Legend

**Figure 29: Access management legend**

### *Tunxis Hill Cutoff to Burroughs Road*

In this segment, access is controlled by the proposed roundabout at Black Rock Turnpike and Tunxis Hill Cutoff. The proposed roundabout allows for the modification of Moritz Place to be right-in/right-out only and allows for the modification of Whitewood Drive to be one-way only towards Black Rock Turnpike. These modifications simplify operations at this existing 5-leg signalized intersection. Additionally, dedicated turn pockets are provided for southbound traffic to turn left onto Candlewood Road, for northbound traffic to turn left onto Judd Street and for northbound traffic to turn left into the Tunxis Hill Shopping Center. Minor driveway modifications are proposed for 1557 Black Rock Turnpike with the reduction of the driveway width to allow for appropriate space for the roundabout to be installed and enhance the pedestrian environment through this area.

**Figure 30: Access management recommendations between Tunxis Hill Cutoff and Burroughs Road**

### *Burroughs Road to Turnpike Shopping Center (ShopRite)*

This segment of the corridor is proposed to look very similar to existing conditions, except for the removal of a driveway at 1838 Black Rock Turnpike and the modification of the southern driveway at the Turnpike Shopping Center to be right-in/out only (vs. the current full-access in/right-out only). Access to 1838 Black Rock Turnpike will be maintained from two access points on Burroughs Road and Katona Drive Extension, while left-turn in access to the Turnpike Shopping Center will be directed to the traffic signal just to the north. The southern driveway to the Turnpike Shopping Center is proposed to be reconstructed in such a way to still allow for delivery trucks to make the left-turn here as this entrance is critical for deliveries for tenants in this plaza.

**Figure 31: Access management recommendations between Burroughs Road and Turnpike Shopping Center**

#### *Turnpike Shopping Center to Stillson Road*

This segment was identified an area of concern with regards to the number of driveway curb-cuts and its vicinity to the congested Stillson Road intersection. Significant access management is recommended to improve traffic safety and generally enhance the operations of the corridor. Key to this plan is the utilization of a back-parking lot (located on the same parcel as 2000 Black Rock Turnpike [Bear & Grill]) to enhance cross property connections and allow for left-turning motorists to utilize the signal at Stillson Road for easier access to Black Rock Turnpike southbound. The proposed concept would eliminate seven driveways in the area while implementing access restrictions on an additional four driveways. These access management recommendations could substantially improve safety and congestion in this area.

**Figure 32: Access management recommendations between Turnpike Shopping Center and Stillson Road**

### *Stillson Road to Black Rock Shopping Center (Old Navy)*

Very minor modifications are proposed to driveway access in this segment. Two driveways are proposed to be eliminated entirely, with the proposed roundabout providing access to these properties at Black Rock Shopping Center and Lake Hills Shopping Center. Elsewhere, minor access restrictions are proposed for several driveways to prohibit left-turning traffic wherever possible. In all cases where left-turning traffic is prohibited, vehicles can exit to the right and circle around the roundabout to complete their journey.

**Figure 33: Access management recommendations between Stillson Road and Black Rock Shopping Center (Old Navy)**

### *Black Rock Shopping Center (Old Navy) to Brookside Drive*

For the last segment, driveway access proposed between the proposed roundabout at the Black Rock Shopping Center and Brookside Drive is limited. A total of three driveways are proposed to be eliminated – two of which at the Lake Hills Shopping Center with new access to the turnpike through the proposed roundabout. The final driveway proposed to be removed is the northern driveway to 2405 Black Rock Turnpike, Conway's Auto Repair, due to its proximity to the adjacent signalized intersection. This property, however, is proposed to maintain full access through its driveway on Brookside Drive and Black Rock Turnpike. In addition, the southern driveway to 2315 Black Rock Turnpike (Duchess Restaurant) is proposed to be modified to restricted access in the outbound direction only. Motorists who intend to turn left to proceed on the Black Rock Turnpike north will be able to make this turn via a U-turn in the proposed roundabout at the Black Rock Shopping Center

**Figure 34: Access management recommendations between Black Rock Shopping Center (Old Navy) and Brookside Drive**

## BLACK ROCK TURNPIKE SAFETY STUDY

### APPENDIX D: TRAFFIC ANALYSIS

MAY 2019

## Black Rock Turnpike Corridor Study Final Report Memo

**TO:** Michael Morehouse, P.E. & Parker Sorenson  
**FROM:** Thomas J. Wamser & Craig D. Yannes, P.E., PTOE  
**DATE:** January 9, 2019

---

The following memorandum summarizes the future and improved conditions assessment that was performed for the Black Rock Turnpike (BRT) Corridor Study (the Study). The first two sections detail the traffic analyses undertaken to review the future traffic conditions of the corridor without any improvements to determine the impact of regional traffic growth followed by a section reviewing the results for the improvement Concepts A and B that have been developed by the study team. The final section provides guidance on Design, Permitting, Construction, and Cost considerations to implement the potential improvements.

### Future Conditions Traffic Assessment

The assessment of future conditions conducts an analysis of the Black Rock Turnpike study area under existing geometric and operational conditions utilizing 2040 Background traffic volumes. This process identifies deterioration of operational efficiency from existing conditions due to regional traffic growth and helps identify areas of concern where no improvements are made to the transportation system.

The future conditions analysis includes traffic projections based on the methodology described in the following section to expand the 2017 Existing traffic volumes to the 2040 Background traffic volumes. The Black Rock Turnpike study area intersections were analyzed under two scenarios: a Background and a Background-Optimized condition. The 2040 Background analysis utilizes existing geometry and existing traffic signal settings to facilitate a direct comparison between existing and future conditions. The 2040 Background-Optimized analysis utilizes existing geometry, but modifies intersection signal timings and settings to provide the most efficient operations for future conditions. This optimization analysis determines if future operational needs can be mitigated through low-cost adjustments to signal operations or if additional physical improvement are needed to provide measurable capacity improvements. Although these Background analyses provide a basis for generating roadway improvements to accommodate anticipated traffic growth for the corridor, they do not factor in safety related issues which was a primary factor in developing corridor improvements.

### Background Traffic Forecasts

As detailed in Section 4 of the Existing and Future Conditions Technical Memorandum, traffic volume and retail market trends suggest that traffic growth along the Black Rock Corridor will remain generally flat over the 20 year study horizon. However, the Town of Fairfield anticipates some additional housing development near the study corridor and recommended that some limited traffic growth be included in the future forecast to ensure conservative estimates for future traffic volumes. As a result, the study team applied a modest growth rate of 0.25% per year from 2017 to 2040. This growth rate was submitted and approved by CTDOT in January 2018. The 2017 Existing Condition Traffic Volumes and the projected 2040 Background Condition traffic volumes are presented in Figures 1 through 4 and Figures 5 through 8, respectively.

## **Background Traffic Operations**

Utilizing the existing geometry and traffic signal settings established under the 2017 Existing Traffic analyses, traffic operations for the 2040 Background Traffic Volumes were evaluated for the study area intersections using Trafficware's *Synchro plus SimTraffic 10 – Traffic Signal Coordination Software*, based on the *Highway Capacity Manual (HCM) 6<sup>th</sup> Edition* methodology.

Figures 9 and 10 and Tables 1 and 2 summarize the 2017 Existing Conditions results for reference purposes, while Figure 11 and 12 and Tables 3 and 4 present the 2040 Background Condition results. Figures 9 through 12 present a geographical representation of the overall signalized intersection LOS and unsignalized approach LOS results on a study area map with the LOS color coded by letter. Within Tables 1 and 3, intersections, approaches, and/or movements with significant delays (LOS E) and failing operations (LOS F) have been highlighted in yellow and red, respectively. Within Tables 2 and 4, intersection approach and/or movement average (50<sup>th</sup> percentile) and/or design queues (95<sup>th</sup> percentile) are highlighted in red when they exceed the available storage length. Overall traffic operations summary tables allowing comparisons for each peak hour across scenarios are included in Appendix A, while capacity analysis worksheets for the Existing and Background traffic analyses are included in Appendix B.

The background traffic growth slightly exacerbates existing capacity issues detailed in the Existing Conditions Technical Memo. Comparing the existing conditions to the background conditions, the following overall LOS deterioration was identified from the analyses during the specified peak hours:

- Black Rock Turnpike at Tahmore Drive: Decreased from C to D in the afternoon
- Black Rock Turnpike at Stillson Road: Decreased from D to E in the afternoon
- Black Rock Turnpike at Fairfield Woods Road: Decreased from A to B on Saturday
- Black Rock Turnpike at Turnpike Shopping Center: Decreased from B to C on Saturday
- Tunxis Hill Cutoff at Tunxis Hill Road (unsignalized): EBL decreased from C to D on Saturday

Select intersection approaches experienced decreases in one category of LOS mainly focused at the intersections where the overall LOS experienced a decrease. These decreases are a result of the incremental increases in traffic volume, which cause incremental increases in delay and subsequent decreases in LOS where existing conditions were on the threshold of two LOS categories. As with the existing conditions, the most significant congestion is focused on the Black Rock Turnpike at Stillson Road (Route 135) intersection.

## **Background Optimized Traffic Operations**

The 2040 Background Traffic Volumes were also analyzed with an optimized traffic network where the lane geometry remained unchanged, but traffic signal timings were optimized and additional coordination was added along the corridors. The purpose of the 2040 Background-Optimized traffic analysis is to determine how the existing signalization along the corridor would process expected future traffic volumes without any significant physical improvements.

The optimization process included a review of the coordinated system on the corridor, the coordinated system cycle lengths, and signal phase timing splits to balance delays on the intersection approaches to increase the efficiency of traffic operations. It also included modifications to the closed loop signal timing offsets which impact the progression of vehicles through the corridor. The optimization method was similar to the process employed by CTDOT, whom monitors state-maintained closed loop systems and periodically modifies the signal timings based on current volumes, to maintain operational efficiency. The optimization of the traffic signal operation included the following:

- Expansion of the existing closed loop coordination system on Route 58 (Black Rock Turnpike) to include all intersections from Tahmore Drive to Tunxis Hill Cutoff except for the intersection with Stillson Road, which runs free from coordination similar to the existing conditions
- Optimization of the study area intersection splits within existing minimums
- Optimization of the network cycle length and offsets for the coordinated system

A summary of the expected traffic operations with the signal optimization is provided in Figures 13 and 14 and Tables 5 and 6. Figures 13 and 14 summarize the overall signalized intersection LOS and unsignalized intersection approach LOS on the study area map with the LOS color coded by letter. Within Table 5, intersections, approaches, and/or movements with significant delays (LOS E) and failing operations (LOS F) have been highlighted yellow and red, respectively. Within Table 6, intersection approach and/or movement average (50<sup>th</sup> percentile) and/or design queues (95<sup>th</sup> percentile) are highlighted in red when they exceed the available storage length. Overall traffic operations summary tables allowing comparisons for each peak hour across the Existing, Background and Background-Optimized scenarios are included in Appendix A, while capacity analysis worksheets for the Background-Optimized traffic analyses are included in Appendix B.

The traffic signal optimization mitigates most of the delay caused by the additional background traffic growth. The following changes to LOS were identified from the analysis:

- Black Rock Turnpike at Tahmore Drive: Improved from D to C in the afternoon
- Black Rock Turnpike at Samp Mortar Drive: Improved from B to A midday
- Black Rock Turnpike at Fairfield Woods Road: Decreased from A to B midday
- Black Rock Turnpike at Turnpike Shopping Center: Improved from C to B on Saturday

The decrease in LOS at the intersection of Black Rock Turnpike at Fairfield Woods Road arose from a higher prioritization of other coordinated intersections in the optimization process in order to facilitate better operations along the corridor in its entirety. Significant overall intersection delays only persist at the intersection of Route 58 (Black Rock Turnpike) at Route 135 (Stillson Road) which operates at overall LOS E during the afternoon peak hour. However, there are individual movements at intersections along the corridor that operate at failing LOS E and F conditions and/or have queues extending beyond available storage. As a result, these Background Optimized analyses served as a basis for the creation of improvement Concepts A and B, which aim to improve traffic congestion, while also balancing traffic safety to accommodate all users of the corridor.

## **Improved Conditions Traffic Assessment**

This section details the study recommendations for transportation system improvements and enhancements. The recommendations address both existing safety issues and capacity issues resulting from the forecasted travel demand for 2040. Two concepts encompassing the entire corridor, Concept A and Concept B, were developed as alternatives for the improved roadway conditions. Concept A mostly addresses safety concerns with the corridor, but does provide additional capacity where possible. These safety-oriented improvements do result in decreased intersection operations at some locations. Concept B also mainly addresses safety issues, while taking a less aggressive approach than Concept A. As a result, Concept B typically provides better intersection traffic operations for vehicles.

### **Concept A Traffic Operations**

Concept A analyzes the 2040 Background Traffic Volumes on a revised traffic network that reflects the conceptual improvements to the study area intersections and roadways. It incorporates extensive physical changes to the corridor as well as changes to the traffic signal settings. From a traffic capacity standpoint, the major changes are as follows:

- Modification to the lane use on the main line, side street, and driveway approaches to provide a single Black Rock Turnpike through lane where possible to calm traffic flow and increase traffic safety
- Relocation of the signalized commercial driveway approach across from Fairfield Woods Road to be a two-way stop controlled intersection approximately 300 feet to the south of the Fairfield Woods Road intersection
- Construction of a modern roundabout at the Old Navy and Trader Joe's Plaza Driveways intersection
- Removal of the traffic signal at the Turnpike Shopping Center and Fairway Plaza Driveway intersection and restriction to right-out only egress while separating the two driveway intersections to allow the installation of a High Intensity Activated Crosswalk for pedestrian crossings between the plazas
- Construction of a modern roundabout at the Katona Drive intersection
- Restriction of northbound left turns from Black Rock Turnpike onto Burroughs Road
- Construction of a modern roundabout at the Tunxis Hill Cutoff Intersection and realignment of Moritz Place to be a two-way stop controlled intersecting Black Rock Turnpike north of the roundabout operation
- Modification of the existing closed loop coordination system on Route 58 (Black Rock Turnpike) to only include the intersections from Tahmore Drive to Fairfield Woods Road
- Optimization of the study area intersection splits within existing minimums
- Optimization of the intersection/network cycle lengths and associated offsets

Due to the scope of the changes detailed above, the 2040 Background Traffic volumes were adjusted with respect to revised traffic patterns expected with the intersection geometry, property access points, and turn restrictions changes along the corridor. These 2040 Concept A traffic volumes are presented in Figures 15 through 18.

A summary of the expected traffic operations under the Concept A conditions is provided in Figures 19 and 20 and Tables 7 and 8. Figures 19 and 20 summarize the overall signalized intersection LOS and unsignalized intersection approach LOS on the study area map with the LOS color coded by letter. Within Table 7, intersections, approaches, and/or movements with significant delays (LOS E) and failing operations (LOS F) have been highlighted yellow and red, respectively. Within Table 8, intersection approach and/or movement average (50<sup>th</sup> percentile) and/or design queues (95<sup>th</sup> percentile) are highlighted in red when they exceed the available storage length. Overall traffic operations summary tables allowing comparisons for each peak hour across the analysis scenarios are included in Appendix A, while capacity analysis worksheets for the Concept A traffic analyses are included in Appendix B.

The Concept A improvements address the corridor safety issues and some capacity issues where possible, but operational deficiencies remain at select intersections in lieu of safety benefits. The following operating conditions were identified from the analysis:

- Intersection overall LOS maintained at an acceptable LOS C or better with the exception of the Black Rock Turnpike at Route 135 (Stillson Road), which operates at overall LOS D in all peaks, and the Black Rock Turnpike at Katona Drive roundabout, which operates at overall LOS E, D, and F in the morning, afternoon, and Saturday midday peaks, respectively.
- Movements and approaches operate acceptably at LOS D or better, with the exception of the following movements, which operate at LOS E during the identified peak hour:
  - Samp Mortar Left Turns in the morning and midday
  - Brookside Drive Left Turns in the morning and afternoon
  - Fairfield Woods Road Right Turns in the morning, midday, and afternoon
  - Black Rock Turnpike at Stillson Road - Black Rock Turnpike Northbound and Southbound Left Turns in the afternoon and Saturday midday; Stillson Road Eastbound and Westbound Throughs in the afternoon

In these cases, the safety improvements and/or the optimization of the traffic signal timing for the project 2040 volumes reduce the operational efficiency for these select approaches in favor of the Black Rock Turnpike main line through movements.

- Design queues for the following select intersection movements extend beyond available storage due to the reduction of a through travel lane on Black Rock Turnpike:
  - Black Rock Turnpike at Fairfield Woods – Black Rock Turnpike Southbound Throughs in the afternoon
  - Black Rock Turnpike at Katona Drive Roundabout – Black Rock Turnpike Northbound Approach in the morning, afternoon, and Saturday midday

- In addition to the queues that extend beyond available storage, there are select movements that experience queues that are within available storage, but extend over approximately 500 feet due to the proposed improvements, including:
  - Black Rock Turnpike at Tahmore Drive – Black Rock Turnpike Southbound Approach in the morning, afternoon, and Saturday midday
  - Black Rock Turnpike at Samp Mortar Drive – Black Rock Turnpike Southbound Throughs in the afternoon and Saturday midday
  - Black Rock Turnpike at Burroughs Road – Black Rock Turnpike Northbound Throughs in the morning

### **Concept B Traffic Operations**

Concept B analyzes the 2040 Background Traffic Volumes on a revised traffic network that reflects the conceptual improvements to the study area intersections and roadways. It incorporates extensive physical changes to the corridor as well as changes to the traffic signal settings. From a traffic capacity standpoint, the major changes are as follows:

- Modification to the lane use on the main line, side street, and driveway approaches to provide a single Black Rock Turnpike through lane where possible to calm traffic flow and increase traffic safety
- Construction of a modern roundabout at the Old Navy and Trader Joe's Plaza Driveways
- Construction of a modern roundabout at the Tunxis Hill Cutoff Intersection and realignment of Moritz Place to be a two-way stop controlled intersection
- Provide separate closed loop coordination systems on Route 58 (Black Rock Turnpike) for the intersections from Tahmore Drive to Fairfield Woods Road and from the Turnpike Shopping Center and Fairway Plaza Driveways to Burroughs Road
- Optimization of the study area intersection splits within existing minimums
- Optimization of the intersection/network cycle lengths and associated offsets

Similar to Concept A, the scope of the changes detailed above result in expected revisions to the traffic patterns along the corridor. As such, the 2040 Background Traffic volumes were adjusted and the 2040 Concept B traffic volumes are presented in Figures 21 through 24.

A summary of the expected traffic operations under the Concept B conditions is provided in Figures 25 and 26 and Tables 9 and 10. Figures 25 and 26 summarize the overall signalized intersection LOS and unsignalized intersection approach LOS on the study area map with the LOS color coded by letter. Within Table 9, intersections, approaches, and/or movements with significant delays (LOS E) and failing operations (LOS F) have been highlighted yellow and red, respectively. Within Table 10, intersection approach and/or movement average (50<sup>th</sup> percentile) and/or design queues (95<sup>th</sup> percentile) are highlighted in red when they exceed the available storage length. Overall traffic operations summary tables allowing comparisons for each peak hour across scenarios are included in Appendix A, while capacity analysis worksheets for the Concept B traffic analyses are included in Appendix B.

Like Concept A, the Concept B improvements address the corridor safety issues, but make fewer vehicular traffic operational concessions. Improvements target capacity issues where possible, but operational deficiencies remain at select intersections in lieu of safety benefits. The following operating conditions were identified from the analysis:

- Intersection overall LOS maintained at an acceptable LOS C or better with the exception of the Black Rock Turnpike at Route 135 (Stillson Road), which operates at overall LOS D in the morning, afternoon and Saturday midday peaks.
- Movements and approaches operate acceptably at LOS D or better, with the exception of the following movements, which operate at LOS E during the identified peak hour:
  - Brookside Drive Left Turns in the afternoon
  - Fairfield Woods Road Through-Left Movements in the midday, afternoon, and Saturday midday and Fairfield Woods Road Right Turns in the afternoon and Saturday midday
  - Black Rock Turnpike at Stillson Road - Black Rock Turnpike Northbound and Southbound Left Turns in the afternoon and Saturday midday

Similar to Concept A, in these cases, the safety improvements and/or the optimization of the traffic signal timing for the project 2040 volumes reduce the operational efficiency for these select approaches in favor of the Black Rock Turnpike main line through movements.

- Design queues for the Black Rock Turnpike Northbound Through-Right Movements at Tahmore Drive extend beyond available storage due to the reduction of a through travel lane on Black Rock Turnpike.
- In addition to the queues that extend beyond available storage, there are select movements that experience queues that are within available storage, but extend over approximately 500 feet due to the proposed improvements, including:
  - Black Rock Turnpike at Tahmore Drive – Black Rock Turnpike Southbound Approach in the morning, afternoon, and Saturday midday
  - Black Rock Turnpike at Samp Mortar Drive – Black Rock Turnpike Southbound Throughs in the afternoon and Saturday midday
  - Black Rock Turnpike at Burroughs Road – Black Rock Turnpike Northbound Through-Left in the morning, afternoon, and Saturday midday

\*Lane uses shown reflect conditions in Concept A

\*\*Measured Available Storages limited to 1000 feet - Storages shown reflect conditions in Concept A

<sup>1</sup>SBTR in Existing Conditions

<sup>2</sup>EBL only present in Concepts A and B

<sup>3</sup>Shell Driveway unsignalized in Existing Conditions; Signalized and analyzed in Concepts A and B only

<sup>4</sup>Commercial Driveway relocated south to unsignalized location in Concept A and not analyzed

<sup>5</sup>WBLT in Existing Conditions and Concept B; WBL in Concept A due to relocation of commercial driveway

<sup>6</sup>NBLT and NBTR in Existing Conditions

<sup>7</sup>SBLT in Existing Conditions

<sup>8</sup>SBTR in Existing Conditions and Concept B; SBT in Concept A due to relocation of commercial driveway

<sup>9</sup>EBTR in Existing Conditions

<sup>10</sup>WBTR in Existing Conditions

## Intersection Summary

Area Type: Other

Cycle Length: 66.3

Actuated Cycle Length: 50.3

Natural Cycle: 55

Control Type: Actuated-Uncoordinated

Maximum v/c Ratio: 0.89

Intersection Signal Delay: 22.2

Intersection LOS: C

Intersection Capacity Utilization 105.8%

ICU Level of Service G

Analysis Period (min) 15

# 95th percentile volume exceeds capacity, queue may be longer.  
Queue shown is maximum after two cycles.

Splits and Phases: 101: Route 58 (Black Rock Turnpike) & Old Black Rock Turnpike/Tahmore Drive

## Intersection Summary

Area Type: Other

Cycle Length: 75

Actuated Cycle Length: 75

Offset: 22 (29%), Referenced to phase 2:SBT and 6:NBTL, Start of Yellow

Natural Cycle: 90

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.69

Intersection Signal Delay: 16.7

Intersection LOS: B

Intersection Capacity Utilization 61.5%

ICU Level of Service B

Analysis Period (min) 15

Splits and Phases: 102: Route 58 (Black Rock Turnpike) & Samp Mortar Drive

## Intersection Summary

Area Type: Other

Cycle Length: 75

Actuated Cycle Length: 75

Offset: 45 (60%), Referenced to phase 2:NBTL and 6:SBT, Start of Yellow

Natural Cycle: 45

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.48

Intersection Signal Delay: 2.9

Intersection LOS: A

Intersection Capacity Utilization 69.6%

ICU Level of Service C

Analysis Period (min) 15

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 103: Route 58 (Black Rock Turnpike) & Brookside Drive

# 104: Route 58 (Black Rock Turnpike) & Commercial Driveway/Fairfield 2017 Existing Conditions Lanes, Volumes, Timings

Cycle Length: 75

Actuated Cycle Length: 75

Offset: 48 (64%), Referenced to phase 2:NBTL and 6:SBTL, Start of Yellow

Natural Cycle: 60

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.90

Intersection Signal Delay: 15.7

Intersection LOS: B

Intersection Capacity Utilization 59.9%

ICU Level of Service B

Analysis Period (min) 15

# 95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Splits and Phases: 104: Route 58 (Black Rock Turnpike) & Commercial Driveway/Fairfield Woods Road

## Intersection Summary

Area Type: Other

Cycle Length: 151.4

Actuated Cycle Length: 106.4

Natural Cycle: 145

Control Type: Actuated-Uncoordinated

Maximum v/c Ratio: 0.95

Intersection Signal Delay: 44.5

Intersection LOS: D

Intersection Capacity Utilization 70.7%

ICU Level of Service C

Analysis Period (min) 15

# 95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Splits and Phases: 105: Route 135 (Stillson Road)/Stillson Road & Route 58 (Black Rock Turnpike)

|                                                                                        |                                                                                        |                                                                                        |                                                                                         |                                                                                          |

## Intersection Summary

Area Type: Other

Cycle Length: 75

Actuated Cycle Length: 75

Offset: 19 (25%), Referenced to phase 2:WBTL and 6:EBTL, Start of Yellow

Natural Cycle: 75

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.50

Intersection Signal Delay: 6.6

Intersection LOS: A

Intersection Capacity Utilization 59.7%

ICU Level of Service B

Analysis Period (min) 15

Splits and Phases: 106: Turnpike Shopping Center Driveway/Fairway Plaza Driveway & Route 58 (Black Rock Turnpike)

|                                                                                            |                                                                                            |                                                                                        |                                                                                          |

## Intersection Summary

Area Type: Other

Cycle Length: 75

Actuated Cycle Length: 75

Offset: 21 (28%), Referenced to phase 2:WBTL and 6:EBTL, Start of Yellow

Natural Cycle: 55

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.64

Intersection Signal Delay: 6.7

Intersection LOS: A

Intersection Capacity Utilization 65.6%

ICU Level of Service C

Analysis Period (min) 15

Splits and Phases: 107: Katona Drive/Katona Drive Ext. & Route 58 (Black Rock Turnpike)

Intersection Summary

Area Type: Other

Cycle Length: 75

Actuated Cycle Length: 75

Offset: 20 (27%), Referenced to phase 2:WBTL and 6:EBTL, Start of Yellow

Natural Cycle: 45

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.80

Intersection Signal Delay: 14.8

Intersection LOS: B

Intersection Capacity Utilization 64.2%

ICU Level of Service C

Analysis Period (min) 15

Splits and Phases: 108: Burroughs Road & Route 58 (Black Rock Turnpike)

|                                                                                           |                                                                                    |

## Intersection Summary

Area Type: Other

Cycle Length: 66.3

Actuated Cycle Length: 47.6

Natural Cycle: 50

Control Type: Actuated-Uncoordinated

Maximum v/c Ratio: 0.64

Intersection Signal Delay: 8.1

Intersection LOS: A

Intersection Capacity Utilization 88.5%

ICU Level of Service E

Analysis Period (min) 15

Splits and Phases: 101: Route 58 (Black Rock Turnpike) & Old Black Rock Turnpike/Tahmore Drive

|                                                                                      |                                                                                        |

## Intersection Summary

Area Type: Other

Cycle Length: 75

Actuated Cycle Length: 75

Offset: 22 (29%), Referenced to phase 2:SBT and 6:NBTL, Start of Yellow

Natural Cycle: 80

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.56

Intersection Signal Delay: 13.1

Intersection LOS: B

Intersection Capacity Utilization 49.6%

ICU Level of Service A

Analysis Period (min) 15

Splits and Phases: 102: Route 58 (Black Rock Turnpike) & Samp Mortar Drive

|                                                                                            |                                                                                            |                                                                                        |                                                                                          |

## Intersection Summary

Area Type: Other

Cycle Length: 75

Actuated Cycle Length: 75

Offset: 45 (60%), Referenced to phase 2:NBTL and 6:SBT, Start of Yellow

Natural Cycle: 45

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.45

Intersection Signal Delay: 3.7

Intersection LOS: A

Intersection Capacity Utilization 64.7%

ICU Level of Service C

Analysis Period (min) 15

Splits and Phases: 103: Route 58 (Black Rock Turnpike) & Brookside Drive

# 104: Route 58 (Black Rock Turnpike) & Commercial Driveway/Fairfield 2017 Existing Conditions Lanes, Volumes, Timings

Timing Plan: Weekday Midday P

## Intersection Summary

Area Type: Other

Cycle Length: 75

Actuated Cycle Length: 75

Offset: 48 (64%), Referenced to phase 2:NBTL and 6:SBTL, Start of Yellow

Natural Cycle: 50

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.65

Intersection Signal Delay: 9.1

Intersection LOS: A

Intersection Capacity Utilization 64.6%

ICU Level of Service C

Analysis Period (min) 15

Splits and Phases: 104: Route 58 (Black Rock Turnpike) & Commercial Driveway/Fairfield Woods Road

|                                                                                            |                                                                                          |                                                                                         |

## Intersection Summary

Area Type: Other

Cycle Length: 151.4

Actuated Cycle Length: 105.5

Natural Cycle: 125

Control Type: Actuated-Uncoordinated

Maximum v/c Ratio: 0.76

Intersection Signal Delay: 37.7

Intersection LOS: D

Intersection Capacity Utilization 72.9%

ICU Level of Service C

Analysis Period (min) 15

# 95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Splits and Phases: 105: Route 135 (Stillson Road)/Stillson Road & Route 58 (Black Rock Turnpike)

|                                                                                        |                                                                                        |                                                                                        |                                                                                         |                                                                                          |

## Intersection Summary

Area Type: Other

Cycle Length: 75

Actuated Cycle Length: 75

Offset: 19 (25%), Referenced to phase 2:WBTL and 6:EBTL, Start of Yellow

Natural Cycle: 80

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.59

Intersection Signal Delay: 10.4

Intersection LOS: B

Intersection Capacity Utilization 69.1%

ICU Level of Service C

Analysis Period (min) 15

Splits and Phases: 106: Turnpike Shopping Center Driveway/Fairway Plaza Driveway & Route 58 (Black Rock Turnpike)

|                                                                                            |                                                                                            |                                                                                        |                                                                                          |

## Intersection Summary

Area Type: Other

Cycle Length: 75

Actuated Cycle Length: 75

Offset: 21 (28%), Referenced to phase 2:WBTL and 6:EBTL, Start of Yellow

Natural Cycle: 45

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.63

Intersection Signal Delay: 7.2

Intersection LOS: A

Intersection Capacity Utilization 67.6%

ICU Level of Service C

Analysis Period (min) 15

Splits and Phases: 107: Katona Drive/Katona Drive Ext. & Route 58 (Black Rock Turnpike)

|                                                                                            |                                                                                            |                                                                                          |

Intersection Summary

Area Type: Other

Cycle Length: 75

Actuated Cycle Length: 75

Offset: 20 (27%), Referenced to phase 2:WBTL and 6:EBTL, Start of Yellow

Natural Cycle: 40

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.69

Intersection Signal Delay: 10.3

Intersection LOS: B

Intersection Capacity Utilization 74.6%

ICU Level of Service D

Analysis Period (min) 15

Splits and Phases: 108: Burroughs Road & Route 58 (Black Rock Turnpike)

Intersection Summary

Area Type:

Other

Cycle Length: 88.8

Actuated Cycle Length: 46.4

Natural Cycle: 55

Control Type: Actuated-Uncoordinated

Maximum v/c Ratio: 0.56

Intersection Signal Delay: 11.8

Intersection LOS: B

Intersection Capacity Utilization 70.6%

ICU Level of Service C

Analysis Period (min) 15

Splits and Phases:

109: Moritz Place/Whitewood Drive & Route 732 (Black Rock Turnpike) & Route 58 (Black Rock Turnpike)/Route 58 (Tunxis Hill Cut

## Intersection Summary

Area Type: Other

Cycle Length: 66.3

Actuated Cycle Length: 64.4

Natural Cycle: 90

Control Type: Actuated-Uncoordinated

Maximum v/c Ratio: 1.02

Intersection Signal Delay: 29.3

Intersection LOS: C

Intersection Capacity Utilization 121.1%

ICU Level of Service H

Analysis Period (min) 15

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

# 95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Splits and Phases: 101: Route 58 (Black Rock Turnpike) & Old Black Rock Turnpike/Tahmore Drive

## Intersection Summary

Area Type: Other

Cycle Length: 75

Actuated Cycle Length: 75

Offset: 22 (29%), Referenced to phase 2:SBT and 6:NBT, Start of Yellow

Natural Cycle: 90

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.71

Intersection Signal Delay: 16.4

Intersection LOS: B

Intersection Capacity Utilization 58.5%

ICU Level of Service B

Analysis Period (min) 15

Splits and Phases: 102: Route 58 (Black Rock Turnpike) & Samp Mortar Drive

|                                                                                            |                                                                                           |                                                                                       |                                                                                         |

## Intersection Summary

Area Type: Other  
Cycle Length: 75  
Actuated Cycle Length: 75  
Offset: 45 (60%), Referenced to phase 2:NBTL and 6:SBT, Start of Yellow  
Natural Cycle: 60  
Control Type: Actuated-Coordinated  
Maximum v/c Ratio: 0.67  
Intersection Signal Delay: 8.0  
Intersection Capacity Utilization 67.6%  
Analysis Period (min) 15

Intersection LOS: A

ICU Level of Service C

Splits and Phases: 103: Route 58 (Black Rock Turnpike) & Brookside Drive

# 104: Route 58 (Black Rock Turnpike) & Commercial Driveway/Fairfield 2017 Existing Conditions Lanes, Volumes, Timings

Timing Plan: Weekday PM Peak

## Intersection Summary

Area Type: Other

Cycle Length: 75

Actuated Cycle Length: 75

Offset: 48 (64%), Referenced to phase 2:NBTL and 6:SBTL, Start of Yellow

Natural Cycle: 60

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.80

Intersection Signal Delay: 11.0

Intersection LOS: B

Intersection Capacity Utilization 78.7%

ICU Level of Service D

Analysis Period (min) 15

# 95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Splits and Phases: 104: Route 58 (Black Rock Turnpike) & Commercial Driveway/Fairfield Woods Road

## Intersection Summary

Area Type: Other

Cycle Length: 151.4

Actuated Cycle Length: 116.1

Natural Cycle: 145

Control Type: Actuated-Uncoordinated

Maximum v/c Ratio: 1.01

Intersection Signal Delay: 53.9

Intersection LOS: D

Intersection Capacity Utilization 85.7%

ICU Level of Service E

Analysis Period (min) 15

# 95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Splits and Phases: 105: Route 135 (Stillson Road)/Stillson Road & Route 58 (Black Rock Turnpike)

|                                                                                        |                                                                                        |                                                                                        |                                                                                         |                                                                                          |

## Intersection Summary

Area Type: Other

Cycle Length: 75

Actuated Cycle Length: 75

Offset: 19 (25%), Referenced to phase 2:WBTL and 6:EBTL, Start of Yellow

Natural Cycle: 90

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.72

Intersection Signal Delay: 12.8

Intersection LOS: B

Intersection Capacity Utilization 76.5%

ICU Level of Service D

Analysis Period (min) 15

Splits and Phases: 106: Turnpike Shopping Center Driveway/Fairway Plaza Driveway & Route 58 (Black Rock Turnpike)

## Intersection Summary

Area Type: Other

Cycle Length: 75

Actuated Cycle Length: 75

Offset: 21 (28%), Referenced to phase 2:WBTL and 6:EBTL, Start of Yellow

Natural Cycle: 50

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 0.68

Intersection Signal Delay: 7.5

Intersection LOS: A

Intersection Capacity Utilization 75.5%

ICU Level of Service D

Analysis Period (min) 15

Splits and Phases: 107: Katona Drive/Katona Drive Ext. & Route 58 (Black Rock Turnpike)

|                                                                                            |                                                                                           |                                                                                         |
